Effect of Laser Radiation on Absorbing Condensed Matter V. B. Fedorov, 1990

The Physics of Laser

Radiation-Matter Interaction Alexander Horn, 2022-11-20 This textbook explains the fundamental processes involved in the interaction of electromagnetic radiation with matter. It leads students from a general discussion of electrodynamics forming the mathematical foundation for the Maxwell equations to key results such as the Fresnel equations, Snell's law and the Brewster angle, deriving along the way the equations for accelerated charges and discussing dipole radiation, Bremsstrahlung and synchrotron radiation. By considering more and more interacting particles, the book advances its treatment of the subject, approaching the solid state regime using both classical and quantum mechanical approaches to describe interaction paths with electromagnetic radiation. Finally, specific interactions of laser radiation with matter are explained, such as ultrafast coherent and selective interaction. With an emphasis on achieving an intuitive grasp of the basic physics underlying common laser technology, this textbook is ideal for graduate students seeking both a better fundamental and applied understanding of laser-matter interaction.

Directed Energy

Weapons Bahman Zohuri, 2016-08-29 This book delves deeply into the real-world technologies behind the directed energy weapons that many believe exist only within the confines of science fiction. On the contrary, directed energy weapons such as high-energy lasers are very real, and this book provides a crash course in all the physical and mathematical concepts that make these weapons a reality. Written to serve both scientists researching the physical phenomena of laser effects as well as engineers focusing on practical applications, the author provides worked examples demonstrating issues such as how to solve for the heat diffusion equation for different boundary and initial conditions. Several sections are devoted to reviewing and dealing with solutions of diffusion equations utilizing the aid of the integral transform techniques. Ultimately, this book examines the state of the art in currently available high-energy laser technologies and suggests future directions for accelerating practical applications in the field.

High Energy Laser (Hel) Bahman Zohuri, 2014-11-22 Directed Energy Weapons is nothing new to mankind; historically, the origination of such weapons falls in centuries ago when, for the first time, the famous Greek mathematician, physicist, engineer, inventor, and astronomer Archimedes of Syracuse used different mirrors to collect sunbeams and focusing them on the Roman fleet in order to destroy enemy ships with fire. This is known as the Archimedes Heat Ray. Archimedes may have used mirrors acting collectively as a parabolic reflector to burn ships attacking Syracuse. The device was used to focus sunlight onto approaching ships, causing them to catch fire. Of course, the myth or reality of Archimedes' Heat Ray is still a questionable story, but certain experiments with the help of a group of students from the Massachusetts Institute of Technology were carried out with 127 one-foot square mirror tiles in October of 2005 that were focused on a mock-up wooden ship at a range of around 100 feet (30 m). The flames broke out on a patch of the ship, but only after the sky had been cloudless and the ship had remained stationary for around ten minutes. It was concluded that

device was a feasible weapon under these conditions
