Cultural Heritage and Aerobiology Paolo Mandrioli, Giulia Caneva, Cristina Sabbioni, 2013-06-29 Aerobiology is the science that studies the biological component of the atmosphere and its effects on living systems and on the environment This term was used for the first time in 1935 but the attention of scientists to the biological component of the atmosphere goes back to 1769 when the Italian biologist Spallanzani carried out a series of experiments that disproved the concept of spontaneous generation of life and proved the presence of viable microorganisms in the air Aerobiology has marked characteristics of interdisciplinarity its application fields range from respiratory diseases to the airborne outbreak of animal and vegetal diseases and to the biodegradation of substances and materials The latter is the subject of this book The purpose of aerobiological research applied to the conservation of cultural heritage is to evaluate the risk of alteration by airborne microorganisms of materials forming artefacts of historical artistic and archaeological interest Airborne spores and vegetative structures may develop on different substrates and may be a cause of degradation in relation to the types of materials the microclimatic situation and the pollution of the conservation environments The qualitative and quantitative evaluation of the biological component of air performed by means of targeted analysis campaigns and of the characteristics of materials and environments supplies indispensable information for the evaluation of the actual risk and the planning of interventions This book is divided into four main parts **Environmental Ecology and Aerobiology** S. Fungi from Different Environments J K Misra, 2019-07-28 Mycologists now look at the genes of fungi to decipher many features that they have been studying in the past beyond just looking at the morphology and other such traits of these organisms Fungi are also attracting the attention of scientists in various other disciplines These include the search for useful fungi in various extreme environments th **Aerobiology, Health Environment** ,1989* **Aerobiology** Michael L. Mulenberg, Harriet A. Burge, 2018-04-20 Aerobiology is the study of airborne particles that have an impact on humans and other organisms Every day we are exposed to airborne particles including natural particles such as pollen bacteria and fungi and unnatural particles such as asbestos fibers and noxious chemicals Aerobiology highlights the current interests in this field primarily the ecology and distribution of airborne particles and their effects on health Aerobiology Harry Salem, Sidney A. Katz, 2016-04-26 This book focusses on the toxicological aspects of aerobiology considering the adverse health effects associated with the inhalation of airborne biological particulates *Biofilms in Medicine, Industry and Environmental Biotechnology* Piet Lens, V. O'Flaherty, A. P. Moran, P. Stoodley, T. Mahony, 2003-04-30 Biofilms are of great

practical importance for beneficial technologies such as water and wastewater treatment and bioremediation of groundwater and soil. In other settings, biofilms cause severe problems, for example, in 65% of bacterial infections currently treated by clinicians, particularly those associated with prosthetics and implants, accelerated corrosion in industrial systems, oil souring, and biofouling. Until recently, the structure and function of biofilms could only be inferred from gross measures of biomass and metabolic activity. This limitation meant that investigators involved in biofilm research and application had only a crude understanding of the microbial ecology, physical structure, and chemical characteristics of biofilms. Consequently, opportunities for the exploitation and control of biofilms were very limited. The past decade has witnessed the development of several new techniques to elucidate the structure and function of biofilms. Examples include the use of molecular probes that identify different microbes in complex communities as well as their metabolic functions, the use of microensors that show concentration gradients of key nutrients and chemicals, the use of confocal laser scanning microscopy to describe the physical structure of biofilms, and the development of a new generation of mathematical models that allow for the prediction of biofilm structure and function. However, much progress remains to be made in efforts to understand, control, and exploit biofilms. This timely book will introduce its readers to the structure and function of biofilms at a fundamental level as determined during the past decade of research, including extracellular polymers as the biofilm matrix, biofilm phenotype, differential gene expression, interspecies signalling, biofilm ecology, biofilm monitoring, resistance of biofilms to antimicrobial agents, and biofilm abatement. Biofilms in Medicine, Industry, and Environmental Technology offers a holistic and multidisciplinary description of the topic, including biofilm formation and composition, but also biofilm monitoring, disinfection, and control. All these aspects are presented from three points of view: medical, industrial, and environmental biotechnological, in a compact, easy-to-read format.

The global environment has significantly changed due to a number of factors such as industrial pollution, expansion of agricultural land, way beyond the fringe forest zones, destruction of virgin forests, loss of quality agricultural lands due to soil erosion, loss of global wildlife and biodiversity, climate change, global warming, devastating forest fires, floods, draughts, melting of glaciers.

to mention a few Human or anthropogenic impacts are in turn devastating the planet with our attention being shifted only to the shining aspect of our civilizations The most alarming fact about this hidden factor is that they are all directly or indirectly impacted by human activities in some way or other The present work Environment at Crossroads deals with various environmental problems like climate change global warming food security bioremediation of waste oil spills and problems of heavy metal toxicity control strategies like use of gene therapy conservation of mangroves revival of river Vishwamitri and role of plant and animals in biodiversity conservation is discussed *6th National Conference on Aerobiology* ,1991
