Environmental Mercury Contamination:

Environmental mercury contamination : this volume is based on an international conference on mercury held at the University of Michigan, with additional material, comments and summaries supplied by the editors Rolf Hartung, 1972

Environmental Mercury Contamination, 1972 *Mercury Contaminated Sites* Ralf Ebinghaus, Ralph R. Turner, Luiz D. de Lacerda, O. Vasiliev, Wim Salomons, 2013-11-11 Mercury is outstanding among the global environmental pollutants of continuing concern. Especially in the last decade of the 20th century, environmental scientists, legislators, politicians, and the public have become more aware of mercury pollution in the global environment. It has often been suggested that anthropogenic emissions are leading to a general increase in mercury on local, regional, and global scales. Numerous industrial activities, including the mining of gold, silver, and mercury itself, have caused mercury contamination of terrestrial and aquatic ecosystems. Mercury-contaminated sites are abundant worldwide. Mercury has been accumulated as an industrial legacy in the rocks, soils, and sediments at and adjacent to industrial sites and now may pose significant risks to human and ecological health. Direct inputs of mercury into the environment by industrial activities have generally decreased significantly in the Western world over the past three decades. However, sources such as coal combustion and the use of mercury in gold and silver mining continue to be of importance on a global scale. The same is true for diffuse sources such as terrestrial landscapes that have been impacted by mercury inputs from the atmosphere in the past. Soils and vegetation located close to large atmospheric mercury sources have clearly been sinks while these sources were active in the past. In the long run, however, these soils may have become important diffuse area sources after the original emissions were discontinued.

Environmental Mercury Contamination Rolf Hartung, Bertram D. Dinman, 1972 **Mercury in the Environment** Michael S. Bank, 2012-05-31 Mercury pollution and contamination are widespread, well documented, and continue to pose a public health concern in both developed and developing countries. In response to a growing need for understanding the cycling of this ubiquitous pollutant, the science of mercury has grown rapidly to include the fields of biogeochemistry, economics, sociology, public health, decision sciences, physics, global change, and mathematics. Only recently have scientists begun to establish a holistic approach to studying mercury pollution that integrates chemistry, biology, and human health sciences. *Mercury in the Environment* follows the process of mercury cycling through the atmosphere, through terrestrial and aquatic food webs, and through human populations to develop a comprehensive perspective on this important environmental problem. This timely reference also provides recommendations on mercury remediation, risk communication, education, and monitoring. **Environmental Mercury Contamination**, 1972* **Environmental Mercury Contamination**, 1974
