Environmental Biotechnology for Waste Treatment Gary S. Saylor, Robert Fox, James Blackburn, 2013-11-11 The use of biotechnical processes in control of environmental pollution and in hazardous waste treatment is viewed as an advantageous alternative or adduct to physical chemical treatment technologies Yet the development and implementation of both conventional and advanced biotechnologies in predictable and efficacious field applications suffer from numerous technical regulatory and societal uncertainties With the application of modern molecular biology and genetic engineering there is clear potential for biotechnical developments that will lead to breakthroughs in controlled and optimized hazardous waste treatment for in situ and unit process use There is however great concern that the development of these technologies may be needlessly hindered in their applications and that the fundamental research base may not be able to sustain continued technology development Some of these issues have been discussed in a fragmented fashion within the research and development community A basic research agenda has been established to promote a sustainable cross disciplinary technology base This agenda includes developing new and improved strains for biodegradation improving bioanalytical methods to measure strain and biodegradation performance and providing an integrated environmental and reactor systems analysis approach for process control and optimization **Environmental Biotechnology** Gareth G. Environmental Biotechnology Lawrence K. Wang,Volodymyr Ivanov,Joo-Hwa Tay,Yung-Tse Hung,2010-04-05 The past 30 years have seen the emergence of a growing desire worldwide that positive actions be taken to restore and protect the environment from the degrading effects of all forms of pollution air water soil and noise Since pollution is a direct or indirect consequence of waste production the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste However as long as waste continues to exist we can only attempt to abate the subsequent pollution by converting it to a less noxious form Three major questions usually arise when a particular type of pollution has been identified 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved This book is one of the volumes of the Handbook of Environmental Engineering series The principal intention of this series is to help readers formulate answers to the last two questions above The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control However the realization of the ever increasing complexity and interrelated nature of current environmental problems renders it imperative that intelligent planning of pollution abatement systems be undertaken
