Empirical methods are means to answering methodological questions of empirical sciences by statistical techniques The methodological questions addressed in this book include the problems of validity reliability and significance In the case of machine learning these correspond to the questions of whether a model predicts what it purports to predict whether a model s performance is consistent across replications and whether a performance difference between two models is due to chance respectively The goal of this book is to answer these questions by concrete statistical tests that can be applied to assess validity reliability and significance of data annotation and machine learning prediction in the fields of NLP and data science Our focus is on model based empirical methods where data annotations and model predictions are treated as training data for interpretable probabilistic models from the well understood families of generalized additive models GAMs and linear mixed effects models LMEMs Based on the interpretable parameters of the trained GAMs or LMEMs the book presents model based statistical tests such as a validity test that allows detecting circular features that circumvent learning Furthermore the book discusses a reliability coefficient using variance decomposition based on random effect parameters of LMEMs Last a significance test based on the likelihood ratio of nested LMEMs trained on the performance scores of two machine learning models is shown to naturally allow the inclusion of variations in meta parameter settings into hypothesis testing and further facilitates a refined system comparison conditional on properties of input data This book can be used as an introduction to empirical methods for machine learning in general with a special focus on applications in NLP and data science The book is self contained with an appendix on the mathematical background on GAMs and LMEMs and with an accompanying webpage including R code to replicate experiments presented in the book *Agents and Artificial*
