Emulsion Polymerization:

Emulsion Polymerization and Emulsion Polymers Peter A. Lovell, Mohamed S. El-Aasser, 1997-04-03 Emulsion Polymerization and Emulsion Polymers Edited by Peter A Lovell Manchester Materials Science Centre UMIST Manchester UK and Mohamed S El Aasser Emulsion Polymers Institute and Department of Chemical Engineering Lehigh University Bethlehem PA USA Emulsion polymerization is a technologically and commercially important reaction used to produce synthetic polymers and latexes for a wide range of applications It is the basis of a massive global industry that is expanding due to the versatility of the reaction and the greater realization of the ability to control properties of the polymer latexes produced Emulsion Polymerization and Emulsion Polymers provides an up to date treatment of both academic and industrial aspects of the subject in a single self contained volume Established knowledge is integrated with latest developments and introductory chapters to give a state of the art summary which is also suitable as a broad based introduction to the field The individual chapters have been written by specialists from academia and industry and are presented in a way which ensures that the book will be of equal value to experienced researchers and students Chemistry and Technology of Emulsion Polymerisation A. M. van Herk, 2013-07-29 Chemistry and Technology of Emulsion Polymerisation 2e provides a practical and intuitive explanation of emulsion polymerization in combination with both conventional and controlled radical polymerization For those working in industry coupling theory with everyday practice can be difficult By carefully explaining the principles of the reaction based on well designed experimental investigation the book explains how the principles relate to practical application The second edition of this book includes a new chapter on morphology of latex particles a rapidly progressing area where modelling the thermodynamic and kinetic aspects of phase separation and morphology has developed into a mature and powerful tool to predict and control morphology of latex particles Another area that is rapidly progressing is the application of controlled radical polymerisation in emulsion polymerization Controlled radical polymerisation is used in aiding encapsulation of inorganic particles like pigment particles and clay platelets These latest developments are included in the second edition *Emulsion Polymerization and Its Applications in Industry* V. I. Eliseeva, S. S. Ivanchev, S. I. Kuchanov, A. V. Lebedev, 2012-12-06 There is a large body of Soviet work on emulsion polymerization spanning a period of over three decades that has been published primarily in the Russian language Most of this has remained untranslated into English and hence unavailable to most other scientists The value of this book lies primarily in the fact that it brings together the most important of these Soviet contributions along with comment and analysis by the authors who may be considered among the foremost authorities in this field in the Soviet Union But the hundreds of literature citations go far beyond the borders of the Soviet Union and serve as an excellent bibliography of the world literature on emulsion polymerization up to the time this book was written The book covers both fundamental and applied aspects In the former are included discussions of particle formation mechanisms a comprehensive theory of emulsion polymerization copolymerization of polar monomers and particle

morphology and its implications with regard to derived film properties Among the applied aspects are discussions of continuous emulsion polymerization both tubular reactors and continuous stirred tank cascades and various aspects concerning the manufacture of some of the most important monomers such as styrene butadiene vinyl acetate methyl methacrylate acrylonitrile and chloroprene This book will be an indispensable reference source for scientists who are entering the field as well as those who are experienced and who have wanted a ready access to this large body of literature

Polymer Nanocomposites by Emulsion and Suspension Polymerization Vikas Mittal, 2010-09-30 Polymer nanocomposites revolutionized research in the composites area by achieving the nanoscale

dispersion of the inorganic filler clay platelets in the polymer matrices after suitable surface modifications of the filler phase. A large number of polymer matrices were tried and nanocomposites with varying degrees of successes were achieved with these polymer systems. The majority of the synthesis are carried out by melt blending which frequently result in the full exfoliation of the filler. However, advanced techniques provide a number of advantages as compared to the melt blending and lead to more uniform composites with enhanced properties. There are a number of recent advances in these methods such as the use of reactive surfactants, modified initiators, advanced clay surface modifications, use of a variety of fillers, inverse polymerization, and miniemulsion polymerization methods which have further led the generation of advanced exfoliated nanocomposites. Until now, most of the published research has been scattered throughout the literature. This book provides a single comprehensive source of information about one of the most important facets of polymer nanocomposites technology: synthesis in emulsion and suspension. These polymerization methods lead to the generation of the well delaminated polymer nanocomposites with a wide range of polymer matrices. This book serves as both a professional reference for experienced researchers and a valuable text for newcomers to the field. It makes the reader aware of the potential commercial use of these recent developments.

Emulsion Polymerization of Vinyl Acetate Mohamed S. El-Aasser, 2012-12-06. It is particularly appropriate that this symposium on the emulsion polymerization of vinyl acetate was held in recognition of the industrial importance of poly vinyl acetate and vinyl acetate copolymers and their rather unique properties among emulsion polymers in general. Poly vinyl acetate latexes were the first synthetic polymer latexes to be made on a commercial scale; their production using polyvinyl alcohol as emulsifier began in Germany during the mid 1930s and has continued to the present day, growing steadily with the years. Indeed, poly vinyl acetate latexes prepared with polyvinyl alcohol are still one of the mainstays of the adhesives industry. With the passing of time, however, vinyl acetate copolymers have been developed: copolymers with maleate esters such as dibutyl maleate, acrylate esters such as ethyl acrylate and butyl acrylate, versatic acid esters, and more recently ethylene. These versatile copolymers have found increasing use in more sophisticated adhesives with specialized properties: adhesives for clay coatings on paper, carpet backing, and interior and exterior paints. Thus, more than 45 years after the first commercial production of vinyl acetate latexes, their use is still growing both in actual quantities and in different applications. The industrial importance of vinyl acetate latexes makes the mechanism and kinetics of their emulsion polymerization of practical as well as scientific interest.
