Advanced Separation Techniques for Nuclear Fuel Reprocessing and Radioactive Waste Treatment Kenneth L Nash, Gregg J Lumetta, 2011-03-15 Advanced separations technology is key to closing the nuclear fuel cycle and relieving future generations from the burden of radioactive waste produced by the nuclear power industry Nuclear fuel reprocessing

techniques not only allow for recycling of useful fuel components for further power generation but by also separating out the actinides lanthanides and other fission products produced by the nuclear reaction the residual radioactive waste can be minimised. Indeed the future of the industry relies on the advancement of separation and transmutation technology to ensure environmental protection, criticality safety and non proliferation i.e. security of radioactive materials by reducing their long term radiological hazard. Advanced separation techniques for nuclear fuel reprocessing and radioactive waste treatment provides a comprehensive and timely reference on nuclear fuel reprocessing and radioactive waste treatment. Part one covers the fundamental chemistry, engineering and safety of radioactive materials separations processes in the nuclear fuel cycle including coverage of advanced aqueous separations engineering as well as on line monitoring for process control and safeguards technology. Part two critically reviews the development and application of separation and extraction processes for nuclear fuel reprocessing and radioactive waste treatment. The section includes discussions of advanced PUREX processes, the UREX concept, fission product separations and combined systems for simultaneous radionuclide extraction. Part three details emerging and innovative treatment techniques, initially reviewing pyrochemical processes and engineering highly selective compounds for solvent extraction and developments in partitioning and transmutation processes that aim to close the nuclear fuel cycle. The book concludes with other advanced techniques such as solid phase extraction, supercritical fluid and ionic liquid extraction and biological treatment processes. With its distinguished international team of contributors, *Advanced separation techniques for nuclear fuel reprocessing and radioactive waste treatment* is a standard reference for all nuclear waste management and nuclear safety professionals, radiochemists, academics and researchers in this field. A comprehensive and timely reference on nuclear fuel reprocessing and radioactive waste treatment. Details emerging and innovative treatment techniques, reviewing pyrochemical processes and engineering as well as highly selective compounds for solvent extraction. Discusses the development and application of separation and extraction processes for nuclear fuel reprocessing and radioactive waste treatment. Extractive Metallurgy Today Fathi Habashi, 2000. *Supramolecular Materials and Technologies* David N. Reinhoudt, 2008-04-30. *Perspectives in Supramolecular Chemistry* relates recent developments and new exciting approaches in supramolecular chemistry. The series covers all areas from theoretical and modelling aspects through organic and inorganic chemistry and biochemistry to materials, solid state and polymer sciences, reflecting the many and varied applications of supramolecular structures in modern chemistry. From the early days of supramolecular chemistry, the field has been associated with possible applications. This is not surprising as the design of new molecules and later of assemblies of molecules is often function driven. Now after three decades of supramolecular chemistry, David Reinhoudt has brought together a collection of reviews to reflect on the applications that have actually been achieved. The first applications in molecular recognition are now established technologies in analytical chemistry, separation science and medicine. More recently, developments have taken place in material design and these concepts are also discussed here.
