Principles of Heating, Ventilation, and Air Conditioning in Buildings John W. Mitchell, James E. Braun, 2012-03-06

Principles of HVAC in Buildings by J W Mitchell and J E Braun provides foundational knowledge for the behavior and analysis of HVAC systems and related devices. The emphasis is on the application of engineering principles and features a tight integration of physical descriptions with a software program that allows performance to be directly calculated with results that provide insight into actual behavior. The examples end of chapter problems and design projects are more than exercises; they represent situations that an engineer might face in practice and are selected to illustrate the complex and integrated nature of an HVAC system or piece of equipment. Coverage of material applicable to the field is broad. A Fundamentals section on thermodynamics, fluid flow, heat transfer, and psychrometrics; types of HVAC systems and components; comfort and air quality criteria; a Loads section on weather data processing, design heating and cooling loads; an Equipment section on air and water distribution systems, heating and cooling coils, cooling towers, refrigeration equipment; and a Design and Control section on seasonal energy use, control techniques, supervisory control, the HVAC design process, and the rules of thumb often used in design. The textbook provides a foundation for students and practicing engineers to design HVAC systems for buildings. In addition, there is extensive supplemental on-line material that provides more in-depth and comprehensive treatment of equipment and component modeling and performance that is geared towards current and future equipment design engineers.

Heating, Ventilation and Air Conditioning Leila Alistair, 2019-06-17 Heating, ventilation, and air conditioning is a technology that is concerned with indoor and vehicular environmental comfort. Its objective is to provide comfort and high indoor air quality. The technology develops on the principles of fluid mechanics, thermodynamics, and heat transfer. Ventilation involves exchanging air in any space in order to control temperature as well as remove odors, dust, airborne bacteria, carbon dioxide, etc. It can be achieved mechanically by using an air handler, mechanical exhausts, or ceiling fans, or naturally using operable windows, louvers, or trickle vents. In central heating, water, steam, or air is heated using a boiler, furnace, or heat pump, and the resultant heat is transferred by the processes of convection, radiation, or conduction to the living spaces in a house or building. Air conditioning and refrigeration involve cooling and humidity control through the removal of heat using heat transfer processes. This book is a compilation of chapters that discuss the most vital concepts about the technology of heating, ventilation, and air conditioning. Such selected concepts that redefine the understanding of the crucial aspects of this technology, including its design, analysis, and control systems, have been presented herein. It will serve as a valuable reference guide for architects, interior designers, professionals, and students involved in this area of study.

Analysis and Design of Heating, Ventilating, and Air-conditioning Systems Herbert W. Stanford, 1988 *Handbook of Heating, Ventilation, and Air Conditioning* Jan F. Kreider, 2000-12-26 The building industry accounts for about 25 percent of the US gross national product through the design, construction, operation, and maintenance of commercial, institutional, and residential buildings. The Handbook of Heating, Ventilation, and Air Conditioning provides a current, comprehensive review of the latest procedures and

trends in the industry It combines practice and theory systems and control and modern methods and technologies to provide in one volume all of the design and operation information needed by HVAC engineers Through a link on the CRC Web site owners of the handbook can access new material periodically posted by the author
