Mendelian Randomization: An Approach for Precision Medicine and Public Health Triinu Peters, Xiaoqing Pan, Yi-Ju Li, Jiayue-Clara Jiang, 2025-04-24 Epidemiological studies have established various observational associations between modifiable human behaviors and disease risk. However, observational studies are prone to unmeasured confounding bias and cannot establish causal associations, which are important to investigate disease treatment and drug development. In 1991, Gray and Wheatley proposed the term Mendelian Randomization, a method that was applied to obtain unbiased estimations of the impact of cancer treatment within a family-based design. The term has since been applied to describe statistical genomic studies that used genetic instruments as proxy for modifiable risk factors or behaviors to infer causal association with diseases. The principle of Mendelian Randomization relies on Mendel's laws of inheritance and random segregation. It is less prone to unmeasured confounding bias and reverse causation compared to observational studies and can be applied to address questions of causality without any typical bias.
