profundidad la ventilación natural y el microclima de un invernadero mediterráneo de estructura múltiple equipado con mallas anti insectos utilizando anemómetros bidimensionales y tridimensionales. La anemometría nos ha permitido describir los patrones del flujo de ventilación natural del invernadero para los vientos predominantes de la zona definiendo las entradas y salidas de aire y estudiar la influencia sobre la ventilación de obstáculos próximos a los laterales del invernadero. A partir de los patrones observados se ha determinado la interacción entre el efecto túnel y el efecto chimenea en la ventilación natural del invernadero y modificado tres modelos basados en la ecuación de Bernoulli según la relación entre ambos efectos. Mediante la anemometría se ha medido el caudal de ventilación G del invernadero para diferentes condiciones de viento en velocidad e intensidad. 18 ensayos. A partir de las características aerodinámicas de las mallas anti insectos obtenidas en un túnel de viento se han determinado los coeficientes de descarga de las ventanas C_d con valores medios de 0.129-0.057 para las ventanas laterales y de 0.175-0.066 para la ventana cenital. A partir de los valores medidos de G de los valores de C_d de los valores medios de temperatura interior T_i y exterior T_e y de la velocidad del viento que se han calculado los coeficientes de fricción C_w del invernadero para tres modelos empíricos de ventilación. Vientos de Levante C_w igual a 0.150-0.005 modelo 1, 0.107-0.011 modelo 2 y 0.154-0.003 modelo 3. Vientos de Poniente C_w igual a 0.177-0.087 modelo 1, 0.281-0.134 modelo 2 y 0.096-0.039 modelo 3. En general se ha observado que la ventilación natural del invernadero es más efectiva cuando el lateral de barlovento se encuentra libre de obstáculos y la ventana cenital abre a sotavento favoreciendo la entrada del aire por las ventanas laterales y la salida por la ventana cenital complementándose el efecto túnel y el efecto chimenea. El coeficiente de efectividad de las ventanas $E_v = C_d / C_w$ fue mayor cuando ambos efectos generan un flujo de aire en el mismo sentido $E_v = 0.092-0.006$ que cuando se oponen $E_v = 0.041-0.015$. Se ha estimado que una malla de 13/30 hilos/cm² porosidad 39.0% provoca una reducción en el número de renovaciones de aire con respecto al invernadero sin malla del 65% en los ensayos realizados con viento de Levante y entre un 74% y 86% en los ensayos realizados con viento de Poniente. La reducción es mayor cuanto menor es la velocidad del viento y por tanto cuando mayores son las necesidades de ventilación. Por otro lado sería necesaria una superficie de ventilación SV del 80% de la superficie cubierta por el invernadero SA para alcanzar 45 h⁻¹ renovaciones de aire para una velocidad de viento de 3 m/s. También se ha comprobado que el uso de mallas anti insectos en las ventanas del invernadero reduce drásticamente los niveles de turbulencia con un valor promedio de la reducción de la energía cinética turbulenta k del 95% llegando a producirse disminuciones de hasta el 99.97%. En esta Tesis también se ha analizado el uso de ventiladores desestratificadores en el interior del invernadero como sistema de apoyo a la ventilación natural. Se observó que aunque los ventiladores ayudan a mezclar y homogeneizar el aire disminuyendo los gradientes verticales de temperatura y aumentando la uniformidad de la temperatura en el interior del invernadero la disposición estudiada alejada de las ventanas no favorece la entrada del aire exterior. Se ha comprobado en campo el efecto sobre la ventilación natural y el microclima del invernadero de dos mallas anti insectos de diferentes propiedades: una malla

comercial de 10 20 hilos cm 2 porosidad 33 5 % y una malla experimental de 13 30 hilos cm 2 39 0 % con mayor densidad de hilos que la malla comercial pero a su vez m s porosa Cada una de las mallas se instal en las ventanas de uno de los dos sectores en los que fue dividido un mismo invernadero En el sector donde se instal la malla experimental se observ un mayor n mero de renovaciones y menor temperatura media del aire El n mero de renovaciones de aire fue un 15% menor en el sector con la malla comercial produci ndose un incremento de temperatura de 0 1oC por punto porcentual de diferencia entre la porosidad de ambas mallas Mediante anemometr a s nica tambi n se ha evaluado un sistema de refrigeraci n de paneles evaporadores y extractores de aire variando su frecuencia de giro se ha comprobado que es un sistema bastante efectivo para evacuar calor y reducir la temperatura del aire en el interior del invernadero Para una frecuencia de giro de los extractores de 40 Hz el sistema mantuvo la temperatura en el interior del invernadero entre 1 2 y 2 6oC por debajo de la temperatura exterior La temperatura dentro del invernadero con cultivo fue entre 2 2 y 5 1oC inferior a la temperatura registrada en otros invernaderos con ventilaci n natural SV SA 18 8% 19 6% y entre 1 4 y 2 4oC inferior a la de otro sector del mismo invernadero con ventilaci n forzada Estas diferencias se incrementaron de manera considerable en ausencia del cultivo El principal inconveniente de este tipo de sistemas son los gradientes de temperatura que se generan en el interior del invernadero y en el sentido de avance del flujo de aire Las diferencias de temperatura entre la zona m s fr a junto al panel y la m s caliente pr xima a los extractores fueron de hasta 5 6oC en los ensayos realizados con cultivo y 8 3oC sin cultivo Tambi n se observaron importantes gradientes verticales de temperatura con un valor medio de 1 0oC m 1 y 2 0oC m 1 para los ensayos realizados con y sin cultivo respectivamente De la comparaci n de los ensayos realizados con y sin cultivo se deduce el efecto laminador que el cultivo produce sobre el flujo de aire en el interior del invernadero El cultivo contribuye a homogeneizar y estabilizar el flujo de aire en el interior y reduce la turbulencia del aire a la vez que genera una direcci n preferente del flujo de aire dada por la disposici n de las l neas de cultivo La anemometr a s nica nos ha permitido determinar que el uso combinado de este sistema de refrigeraci n con los ventiladores desestratificadores es una buena alternativa para reducir los gradientes de temperatura y que su uso combinado con una malla de sombreado incrementa la capacidad del sistema para reducir la temperatura dentro del invernadero Se ha detectado la necesidad de realizar un mantenimiento peri dico del sistema y que el uso de una sola caja de medida de temperatura y humedad en el centro del invernadero no es adecuado para el control de este tipo de sistemas Para el seguimiento de la temperatura del cultivo mediante termograf a infrarroja durante los ensayos realizados para evaluar el sistema de refrigeraci n fue necesario determinar la emisividad de las hojas del cultivo Se ha obtenido en laboratorio la emisividad de nueve cultivos hort colas recomend ndose un valor de emisividad de 0 98 como referencia para la medida de la temperatura de estos cultivos Historia de Espa a Sociedad literaria,1845 **Phisonomia y varios secretos de naturaleza: Contiene cinco tratados de materias diferentes, todos reuistos y mejorados en esta tercera impression, etc** Ger nimo CORTÈS,1741 *Joan B. Pastor Aicart Josep*

Martínez Sanchis,2011-11-28 Joan B Pastor Aicart Beneixama 1849 1917 va ser metge rural i un escriptor molt prolífic tant en castell com en valenci. Si bé ha estat conegut com a poeta la seua obra abraça tot tipus de gèneres literaris: assaig, teatre, articles de premsa, crònica literària, narrativa curta, etc. Fins ara la seua figura ha passat desapercibuda dins del moviment de la Renaixença valenciana tot i ser l'autor més premiat al llarg dels territoris de parla catalana durant aquells anys de renaixement lingüístic. El caràcter conservador i religiós d'una bona part de la seua obra i el seu tarannà social discret que el va fer viure lluny de la capital i sempre més atent al treball que no a l'aparició en els cenacles literaris de l'època han mantingut probablement oculta la importància dels seus escrits. Aquest llibre que intenta ser una reconstrucció de la seua biografia intel·lectual presenta també una breu selecció dels seus textos més rellevants. Meteorología y Climatología ZÚÑIGA LÓPEZ Ignacio, CRESPO DEL ARCO Emilia, 2021-03-09 Este es un libro dirigido a los estudiantes de Meteorología y Climatología de los grados en Ciencias Ambientales y Físicas de la UNED pero también puede ser de interés para cualquier lector interesado en los fundamentos de la Meteorología y en los factores que determinan el clima y el cambio climático. Es un texto introductorio con un enfoque principalmente práctico. Sin renunciar al necesario rigor se ha reducido en lo posible el formalismo matemático para resaltar el significado físico de los procesos fundamentales que determinan el tiempo atmosférico y el clima. Aunque el texto contiene cuestiones al final de cada capítulo una numerosa colección de ejercicios prácticos relacionados con la materia tratada en este libro se puede encontrar en Problemas de Meteorología y Climatología de I. Zúñiga E. Crespo, Julio Fernández y C. Santos publicado en esta misma editorial. En esta primera edición en la colección de Grado se ha revisado todo el texto y se ha reescrito completamente el capítulo dedicado al cambio climático. Ignacio Zúñiga López y Emilia Crespo del Arco son catedráticos de Universidad en la Facultad de Ciencias de la UNED. Los temas de investigación en los que han trabajado se encuadran en el campo de las inestabilidades hidrodinámicas tanto en fluidos complejos como en suspensiones coloidales y polímeros.
