Electron Beam Testing Technology:

Electron Beam Testing Technology John T.L. Thong, 2013-06-29 Although exploratory and developmental activity in electron beam testing EBT 25 years it was not had already been in existence in research laboratories for over until the beginning of the 1980s that it was taken up seriously as a technique for integrated circuit IC testing While ICs were being fabricated on design rules of several microns the mechanical needle probe served quite adequately for internal chip probing This scenario changed with growing device complexity and shrinking geometries prompting IC manufacturers to take note of this new testing technology It required several more years and considerable investment by electron beam tester manufacturers however to come up with user friendly automated systems that were acceptable to IC test engineers These intervening years witnessed intense activity in the development of instrumentation testing techniques and system automation as evidenced by the proliferation of technical papers presented at conferences With the shift of interest toward applications the technology may now be considered as having come of age Electron Beam Testing Technology for High-speed Device Characterisation John Thiam Leong Thong, 1989 Vacuum Electronics Joseph A. Eichmeier, Manfred Thumm, 2008-03-04 Nineteen experts from the electronics industry research institutes and universities have joined forces to prepare this book It does nothing less than provide a complete overview of the electrophysical fundamentals the present state of the art and applications as well as the future prospects of microwave tubes and systems The book does the same for optoelectronics vacuum devices electron and ion beam devices light and X ray emitters particle accelerators and vacuum interrupters

Methods and Materials in Microelectronic Technology Joachim Bargon, 2013-03-09 The papers collected in this volume were presented at the International Symposium on Methods and Materials in Microelectronic Technology This symposium was sponsored by IBM Germany and it was held September 29 October 1 1982 in Bad Neuenahr West Germany The progress of semiconductor and microelectronic technology has become so rapid and the field so sophisticated that it is imperative to exchange the latest insight gained as frequently as it can be accomplished In addition it is peculiar for this field that the bulk of the investigations are carried out at industrial research and development laboratories which makes some of the results less readily accessible Because of these circumstances the academic community which among other things is supposed to communicate the progress in this field to students of different disciplines finds it rather difficult to stay properly informed It was the intent of this IBM sponsored symposium to bring together key scientists from academic institutions primarily from Europe with principal investigators of the industrial scene Accordingly this symposium exposed technologists to scientists and vice versa Scientific advances often lead directly to technological innovations In turn new technologies are often arrived at empirically and because of that are initially poorly understood Scientific inquiry then attempts to probe these processes and phenomena in order to achieve a better understanding Thus science and technology are intricately

interconnected and it is important that technical exchange between technologists and scientists is facilitated since the problems are typically interdisciplinary in nature

Advances in Imaging and Electron Physics Peter W.

Hawkes, 2004-12-18 A special volume devoted principally to the role of the late Sir Charles Oatley in the development of the scanning electron microscope. It contains historical articles and reminiscences by most of the scientists who have worked on the scanning electron microscope in Oatley's laboratory. Emphasizes broad and in-depth article collaborations between world renowned scientists in the field of image and electron physics. Although the scanning electron microscope had a prehistory in Germany and the USA its real champion was Charles Oatley who launched his project in the Cambridge University Engineering Department shortly after the end of World War II. A first microscope was built successfully by D McMullan, one of the Guest Editors of this volume and a succession of progressively improved instruments followed. One in particular built by K C A Smith was commissioned specially for the Canadian Pulp and Paper Research Institute for use in their Montreal laboratories. All these efforts culminated in the commercial model built by the Cambridge Instrument Company and marketed in 1965 under the trade name Stereoscan. Although this story has been told on several occasions in particular in these *Advances* it seemed appropriate in the centenary year of the birth of Sir Charles Oatley that more details should be published to celebrate these achievements. This volume is the result. It contains not only historical articles and reminiscences by most of the scientists who have worked on the scanning electron microscope in Oatley's laboratory but also full or partial reproductions of many of the key publications beginning with McMullan's early paper of 1953 and including Oatley's own *Early history of the scanning electron microscope* 1982. A website has been created in which supplementary material is collected. This volume is a tribute to a bold pioneering scientist and a vivid record of the creation of the first commercial scanning electron microscopes and of subsequent developments. A special volume devoted principally to the role of the late Sir Charles Oatley in the development of the scanning electron microscope. It contains historical articles and reminiscences by most of the scientists who have worked on the scanning electron microscope in Oatley's laboratory.
