Jongen, P. Jonker, F. Twilt, 1986 In this second volume we pay attention to three important subjects in nonlinear optimization The first one concerns the dependence of an optimization problem on the problem data stability resp sensitivity aspects are considered from both a local and global point of view Since stability results are intimately related with some concepts of transversality we treat transversality theory in detail A second subject consists on one hand of gradients the gradient differential equation and its use in the search for several local minima On the other hand we treat the underlying differential equation for Newton's method for finding critical points of a function Again transversality plays a crucial role Finally we consider optimization problems depending on parameters critical sets bifurcation of the feasible set etc The present volume is preceded by a first one in which we study manifolds with boundary and critical point theory Morse theory within the framework of nonlinear optimization *Nonlinear Optimization in IRn* Hubertus Th. Jongen, P. Jonker, F. Weber, 2014-08-20 The book is the first systematical treatment of the theory of finite elements in Archimedean vector lattices and contains the results known on this topic up to the year 2013 It joins all important contributions achieved by a series of mathematicians that can only be found in scattered in literature Börsenblatt für den deutschen Buchhandel, 1980 Nonlinear Analysis - Theory and Methods Nikolaos S. Papageorgiou, Vicențiu D. Rădulescu, Dušan D. Repovš, 2019-02-26 This book emphasizes those basic abstract methods and theories that are useful in the study of nonlinear boundary value problems The content is developed over six chapters providing a thorough introduction to the techniques used in the variational and topological analysis of nonlinear boundary value problems described by stationary differential operators The authors give a systematic treatment of the basic mathematical theory and constructive methods for these classes of nonlinear equations as well as their applications to various processes arising in the applied sciences They show how these diverse topics are connected to other important parts

of mathematics including topology functional analysis mathematical physics and potential theory Throughout the book a nice balance is maintained between rigorous mathematics and physical applications The primary readership includes graduate students and researchers in pure and applied nonlinear analysis
