 development of computational models of design founded on the artificial intelligence paradigm has provided an impetus for  
 much of current design research As artificial intelligence has matured and developed new approaches so the impact of these  
 new approaches on design research has been felt This can be seen in the way concepts from cognitive science have found  
 their way into artificial intelligence and hence into design research And also in the way in which agent based systems  
 are being incorporated into design systems In design research there is an increasing blurring between notions drawn from  
 artificial intelligence and those drawn from cognitive science Whereas a number of years ago the focus was largely on  
 applying artificial intelligence to designing as an activity thus treating designing as a form of problem solving today we are  
 seeing a much wider variety of conceptions of the role of artificial intelligence in helping to model and comprehend designing  
 as a process Thus we see papers in this volume which have as their focus the development or implementation of frameworks

for artificial intelligence in design attempting to determine a unique locus for these ideas We see papers which attempt to find foundations for the development of tools based on the artificial intelligence paradigm often the foundations come from cognitive studies of human designers

Thermal Processes in Welding Victor A. Karkhin, 2019-05-15 This book describes and systemizes analytical and numerical solutions for a broad range of instantaneous and continuous stationary and moving concentrated and distributed 1D 2D and 3D heat sources in semi infinite bodies thick plane layers thin plates and cylinders under various boundary conditions The analytical solutions were mainly obtained by the superimposing principle for various parts of the proposed 1D 2D and 3D heat sources and based on the assumption that only heat conduction plays a major role in the thermal analysis of welds Other complex effects of heat transfer in weld phenomena are incorporated in the solutions by means of various geometrical and energetic parameters of the heat source The book is divided into 13 chapters Chapter 1 briefly reviews various welding processes and the energy characteristics of welding heat sources while Chapter 2 covers the main thermophysical properties of the most commonly used alloys Chapter 3 describes the physical fundamentals of heat conduction during welding and Chapter 4 introduces several useful methods for solving the problem of heat conduction in welding Chapters 5 and 6 focus on the derivation of analytical solutions for many types of heat sources in semi infinite bodies thick plane layers thin plates and cylinders under various boundary conditions The heat sources can be instantaneous or continuous stationary or moving concentrated or distributed 1D 2D or 3D In Chapter 7 the temperature field under programmed heat input pulsed power sources and weaving sources is analyzed In turn Chapters 8 and 9 cover the thermal cycle melting and solidification of the base metal Heating and melting of filler metal are considered in Chapter 10 Chapter 11 addresses the formulation and solution of inverse heat conduction problems using zero first and second order algorithms while Chapter 12 focuses on applying the solutions developed here to the optimization of welding conditions In addition case

studies confirm the usefulness and feasibility of the respective solutions Lastly Chapter 13 demonstrates the prediction of local microstructure and mechanical properties of welded joint metals while taking into account their thermal cycle The book is intended for all researches welding engineers mechanical design engineers research engineers and postgraduate students who deal with problems such as microstructure modeling of welds analysis of the mechanical properties of welded metals weldability residual stresses and distortions optimization of welding and allied processes prewelding heating cladding thermal cutting additive technologies etc It also offers a useful reference guide for software engineers who are interested in writing application software for simulating welding processes microstructure modeling residual stress analysis of welds and for robotic welding control systems
