Electric Machine Dynamics I. Boldea, Syed A. Nasar, 1986-01-01 **Electrical Machine Dynamics** D. P. Sen Gupta, John Williamson Lynn, 1980 *Dynamics of Saturated Electric Machines* Vlado Ostovic, 2012-12-06 This book is a result of the author's work which was initiated about a decade ago and which in the meantime has resulted in his Ph D Thesis and several technical papers The book deals with accurate modeling of electric machines during transient and steady states a topic which has been usually avoided in the literature The modeling techniques herein take into account all machine peculiarities such as the type and connection of its windings slotting and saturation in the iron core A special emphasis in the book is given to the exact physical interpretation of all phenomena which influence the machine's transient behavior Besides the Introduction the book has five chapters The second chapter describes basic concepts of the magnetic equivalent circuit theory and has examples of magnetic equivalent circuits of several types of machines with their node potential equations In the third chapter the transform matrices w and w of A C windings are derived These matrices play a very important role in the magnetic equivalent circuit theory because they connect the quantities from the machine's magnetic equivalent circuit branch fluxes and mmfs with the machine's phase currents and fluxes Electric Machines George Julius Thaler, 1974

A Dynamic Model of the General Theory of Electric Machines A. V. Gaponov-Grekhov, 1953 *Electrical Machines and Drives* Jan A. Melkebeek, 2018-01-20 This book aims to offer a thorough study and reference textbook on electrical machines and drives The basic idea is to start from the pure electromagnetic principles to derive the equivalent circuits and steady state equations of the most common electrical machines in the first parts Although the book mainly concentrates on rotating field machines the first two chapters are devoted to transformers and DC commutator machines The chapter on transformers is included as an introduction to induction and synchronous machines their electromagnetics and equivalent circuits Chapters three and four offer an in depth study of induction and synchronous machines respectively Starting from their electromagnetics steady state equations and equivalent circuits are derived from which their basic properties can be deduced The second part discusses the main power electronic supplies for electrical drives for example rectifiers choppers cycloconverters and inverters Much attention is paid to PWM techniques for inverters and the resulting harmonic content in the output waveform In the third part electrical drives are discussed combining the traditional rotating field and DC commutator electrical machines treated in the first part and the power electronics of part two Field orientation of induction and synchronous machines are discussed in detail as well as direct torque control In addition also switched reluctance machines and stepping motors are discussed in the last chapters Finally part 4 is devoted to the dynamics of traditional electrical machines Also for the dynamics of induction and synchronous machine drives the electromagnetics are used as the starting point to derive the dynamic models Throughout part 4 much attention is paid to the derivation of analytical models But of course the basic dynamic properties and probable causes of instability of induction and synchronous machine drives are discussed in detail as well with the derived models for stability in the small as starting point In addition to the study of the stability in the small a chapter is devoted to large scale

dynamics as well e g sudden short circuit of synchronous machines The textbook is used as the course text for the Bachelor s and Master s programme in electrical and mechanical engineering at the Faculty of Engineering and Architecture of Ghent University Parts 1 and 2 are taught in the basic course Fundamentals of Electric Drives in the third bachelor Part 3 is used for the course Controlled Electrical Drives in the first master while Part 4 is used in the specialised master on electrical energy

Practical Control of Electric Machines for EV/HEVs Shuiwen Shen, Qiong-zhong Chen, 2023-09-01 Upon the ongoing profound revolution in the automotive industry this book is primarily intended to give guidance on the practical design of traction motor control for pure electric vehicles EVs and hybrid electric vehicles HEVs An overview of the state of the art motor types is provided to help understanding the background of automotive motor drives and the EV HEV motor control specifications Using AC induction motor control as a benchmark example it addresses the motor control techniques by means of design analysis examples with MATLAB scripts wherever applicable and practical control software architecture diagrams In particular an extensive analysis and discussion are made on the widely used vector control method together with multiple optimization schemes As such it gives coverage of the electric traction control including dynamics efficiency and the high speed power capability taking into account the constraints of vehicle configuration and requirements The vector control and optimization strategies presented in this book can be ported across to other AC motor types without losing much generality This book tries to bridge the gap between theory and practicality Beginning with basic motor theory and completing the motor control design by introducing voltage source inverter VSI pulse width modulation PWM techniques it helps the reader take a step by step approach from understanding fundamental motor characteristics through to practical design of in depth motor control strategies

Dynamics of Rotating Machines M. I. Friswell, 2010-03-31 Enables engineers to understand the dynamics of rotating machines from basic explanations to detailed numerical models and analysis
