Electrical Control and Quantum Chaos with a High-Spin Nucleus in Silicon Serwan Asaad, 2021-10-19 Nuclear spins are highly coherent quantum objects that were featured in early ideas and demonstrations of quantum information processing In silicon the high fidelity coherent control of a single phosphorus ^{31}P nuclear spin $I = 1/2$ has demonstrated record breaking coherence times entanglement and weak measurements In this thesis we demonstrate the coherent quantum control of a single antimony ^{123}Sb donor atom whose higher nuclear spin $I = 7/2$ corresponds to eight nuclear spin states However rather than conventional nuclear magnetic resonance NMR we employ nuclear electric resonance NER to drive nuclear spin transitions using localized electric fields produced within a silicon nanoelectronic device This method exploits an idea first proposed in 1961 but never realized experimentally with a single nucleus nor in a non polar crystal such as silicon We then present a realistic proposal to construct a chaotic driven top from the nuclear spin of ^{123}Sb Signatures of chaos are expected to arise for experimentally realizable parameters of the system allowing the study of the relation between quantum decoherence and classical chaos and the observation of dynamical tunneling These results show that high spin quadrupolar nuclei could be deployed as chaotic models strain sensors hybrid spin mechanical quantum systems and quantum computing elements using all electrical controls *2013 International Conference on Electrical, Control and Automation Engineering (ECAE2013)*
