Randell,2012-12-06 My interest in the history of digital computers became an active one when I had the fortune to come across the almost entirely forgotten work of PERCY LUDGATE who designed a mechanical program controlled computer in Ireland in the early 1940s I undertook an investigation of his life and work during which I began to realise that a large number of early developments which we can now see as culminating in the modern digital computer had been most undeservedly forgotten Hopefully historians of science some of whom are now taking up the subject of the development of the computer and accumulating valuable data particularly about the more recent events from the people concerned will before too long provide us with comprehensive analytical accounts of the invention of the computer The present book merely aims to bring together some of the more important and interesting written source material for such a history of computers Where necessary papers have been translated into English but every attempt has been made to retain the flavour of the original and to avoid possibly misleading use of modern computing terminology      **A Survey of Automatic Digital Computers** United States. Rojas,Ulf Hashagen,2002-07-26 This history of computing focuses not on chronology what came first and who deserves credit for it but on the actual architectures of the first machines that made electronic computing a practical reality The book covers computers built in the United States Germany England and Japan It makes clear that similar concepts were often pursued simultaneously and that the early researchers explored many architectures beyond the von Neumann architecture that eventually became canonical The contributors include not only historians but also engineers and computer pioneers An introductory chapter describes the elements of computer architecture and explains why being first is even less interesting for computers than for other areas of technology The essays contain a remarkable amount of new material even on well known machines and several describe reconstructions of the historic machines These investigations are of more than simply historical interest for architectures designed to solve specific problems in the past may suggest new approaches to similar problems in today s machines Contributors Titiimaea F Ala ilima Lin Ping Ang William Aspray Friedrich L Bauer Andreas Brennecke Chris P Burton Martin Campbell Kelly Paul Ceruzzi I Bernard Cohen John Gustafson Wilhelm Hopmann Harry D Huskey Friedrich W Kistermann Thomas Lange Michael S Mahoney R B E Napper Seiichi Okoma Hartmut Petzold Ra l Rojas Anthony E Sale Robert W Seidel Ambros P Speiser Frank H Sumner James F Tau Jan Van der Spiegel Eiiti Wada Michael R Williams

*Birthing the Computer* From Relays to Vacuum Tubes is the first in a multi volume series on historical computing machines This series will span the development of computer systems from the Zuse machines of the early 1930s to about 1995 when microprocessors began to be commoditized Each volume will focus on a range of technologies or a class of machines or a particular vendor and will describe the hardware of the machines and its peripherals the operating system and system

software and its influence upon programming languages This volume begins with the Zuse machines which were constructed from relays but contained the basic elements of a computer system namely input computing engine and output Early machines from Atanasoff and Berry Aiken Stibitz and IBM are described The transition from relays to vacuum tubes increased speed and performance significantly and led to the first true computers in ENIAC EDSAC and EDVAC which used paper tape and Williams tubes for I O and storage These machines were built by universities Several early machines were purpose built such as Colossus and BINAC and created with government support and industrial know how By the mid to late 50s computing machines were being built by universities the SSEM Whirlwind and IAS machines governments the NBS SEAC and SWAC and several other machines and industry the UNIVAC series and the English Electric DEUCE Most of these machines were constructed using the von Neumann architecture and represent an evolution of thinking in how computing machines were to operate along with some innovative ideas in software and programming languages By the end of the 1950s the design development programming and use of computing machines were in full ferment as many new ideas were proposed many different machines were designed and some were constructed Computing machines became a commercial enterprise Governments receded from building machines to levying requirements and funding construction while universities continued to explore new architectures new operating systems and new programming languages      *Miscellaneous Publication - National Bureau of Standards* United States.
