Partnerships and New Roles in the 21st-Century

Academic Library Bradford Lee Eden, 2015-09-18 The fifth volume in this series focuses on creating partnerships and developing new roles for libraries in the 21st century It includes such topics such as consulting coaching assessment and engagement partnerships university commercialization adult student support librarian faculty partnerships in developing and supporting new academic courses and creating and staffing the information commons The concept of embedded librarianship

is touched upon in the context of extending the role of the librarian outside the library. The chapters in this volume demonstrate that just as students are extending the ways in which they learn, librarians must embrace new roles and modalities if they are to provide the types of support required by patrons. A typical example of growing importance is massive open online courses (MOOCs), which create challenges and opportunities as they are constantly evolving, they change fundamentally the way students interact with teachers, their fellow students, any course content, and existing or new library services. To survive, librarians need to be engaged in ways that push beyond current professional limits in order to better support the needs of learners. Doing this will not be an easy task, but one that librarians are certainly up to. It is hoped that this volume and the series in general will be a valuable and exciting addition to the discussions and planning surrounding the future directions, services, and careers in the 21st-century academic library.

The Electronic Design Automation Handbook Dirk Jansen, 2010-02-23. When I attended college, we studied vacuum tubes in our junior year. At that time, an average radio had vacuum tubes, and better ones even seven. Then transistors appeared in the 1960s. A good radio was judged to be one with more than ten transistors. Later, good radios had 15-20 transistors, and after that, everyone stopped counting transistors. Today, modern processors running personal computers have over 10 million transistors, and more millions will be added every year. The difference between 20 and 20M is in complexity, methodology, and business models. Designs with 20 transistors are easily generated by design engineers without any tools, whilst designs with 20M transistors can not be done by humans in reasonable time without the help of Prof. Dr. Gajski. This demonstrates the Y-chart automation. This difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice. By the decomposition of the design process into many tasks and abstraction levels, the methodology of designing chips or systems has also evolved. Similarly, the business model has changed from vertical integration, in which one company did all the tasks from product specification to manufacturing, to globally distributed, client-server production, in which most of the design and manufacturing tasks are outsourced.

Advances in Future Manufacturing Engineering Guohui Yang, 2015-06-11. The International Conference on Future Manufacturing Engineering (ICFME) 2014 was held in Hong Kong, December 10-11, 2014. It gathered academics, industry managers, and experts, manufacturing engineers, university students, all interested or proficient in the field of manufacturing engineering, including research, design, and development of systems. p.
