Electrooptical Arrays:

Electrooptical Arrays Dmitrii I. Voskresenskii, Aleksandr I. Grinev, Evgenii N. Voronin, 2013-06-29 Modern radar telecommunication sonar and radio astronomy systems use integrated systems complex signals and signal processing methods extensively. These systems require the development of new more efficient systems. One of the major ways to improve radar and sonar systems is to use multichannel systems the most promising of which employ space time signal processing. In the last few years the intensive growth in electronics information processing techniques microwave and laser technology electrooptics and holography acoustics and optoelectronics have resulted in new scientific and technological research fronts. One of these is the theory and technology of electrooptical array antennas a new class of receiving antennas whose pattern is controlled by means of coherent optics and holography. Electrooptical array theory and technology have been involved in the study of the power resolution and range characteristics of arrays with various coherent optical processors. The practical applications of these systems and methods for building them using contemporary optoelectronics have also been studied.

All theoretical approaches, measurement techniques, materials, technologies, and applications are covered. With more than 1 800 bibliographic citations, 324 figures, 218 tables, and 812 equations, this book is an invaluable reference source for graduate and undergraduate students, researchers, scientists, and engineers working in academia and industries in chemistry, solid state physics, materials science, optical and polymer engineering, and computational science.

Introduction to Infrared and Electro-optical Systems Ronald G. Driggers, Melvin H. Friedman, Jonathan Nichols, 2012 This comprehensive reference details the principles and components of the Linear Shift Invariant LSI infrared and electro optical systems and shows you how to combine this approach with calculus and domain transformations to achieve a successful imaging system analysis. Ultimately, the steps described in this book lead to results in quantitative characterizations of performance metrics such as modulation transfer functions, minimum resolvable temperature difference, minimum resolvable contrast, and probability of object discrimination. The book includes an introduction to two dimensional functions and mathematics which can be used to describe image transfer characteristics and imaging system components. You also learn diffraction concepts of coherent and incoherent imaging systems which show you the fundamental limits of their performance. By using the evaluation procedures contained in this desktop reference, you become capable of predicting both sensor test and field performance and quantifying the effects of component variations.
