Elemental Analysis of Airborne Particles

Evaluating XRF, ICP-OES, and ICP-MS Analytical Technologies

Introduction

Air pollution is a continuous concern of industries, governments, and populations worldwide. Particularly the harmful health effects of the exposure to heavy metals such as lead, arsenic, or cadmium absorbed into particulate matter, carried through the air, and introduced into the lungs and body are within focus.

These particles are principally generated by processes such as combustion. Monitoring and analysis of the elements present in these airborne particles is performed by a variety of organizations, - by industry, environmental protection agencies, as well as research institutes and testing laboratories for

environmental and occupational health and safety.

Fortunately, modern laboratory-grade spectrometric analyzers are available that can handle the necessary analyses. They provide accurate, efficient airborne elemental particle identification and measurement. This paper explains several of the methodologies commonly employed for these applications — focusing on ED-XRF, ICP-OES, and ICP-MS technologies — and describes the desirable attributes of suitable analyzer models for each.
