**Management** Donald H. Whitmore, 1990-09-24 Probably the most ubiquitous biochemical method used today for examining the genetics of individuals populations or phylogenetic relationships between taxa is electrophoresis This book has been created to offer a viewpoint regarding current electrophoretic separation methodologies of macromolecules and their major applications to fisheries management The chapters in this book have been selected and organized into three sections to create a carefully blended mixture of methodologies and applications designed to educate the novice as well as stimulate interest in professional researchers currently using electrophoresis for their work The first section includes chapters that discuss the principles that explain the genetic basis of multiple molecular forms of proteins the theory and practice of DNA analyses and the methodology of electrophoretic separation of these macromolecules starch gel electrophoresis as the predominant electrophoretic tool for fisheries genetics and protein isoelectric focusing and DNA analysis The second section describes a variety of applications for electrophoretic techniques The third section presents a discussion and results of experiments conducted by Dennis Powers and his associates regarding the physiological significance of multiple forms of enzymes using the fish *Fundulus heteroclitus* as a model system The book features a catalog of nearly 100 enzyme staining recipes and covers new areas in electrophoretic work such as DNA fingerprinting genetic tags mitochondrial DNA methodologies and genomic manipulation of fish stocks This book will provide a useful reference resource for fisheries biologists at federal state and local levels fisheries researchers at universities and students pursuing degrees involving research in fish genetics

*Analysis of Peptides and Proteins by Electrophoretic Techniques* Angela R. Piergiovanni, José Manuel Herrero-Martínez, 2019-07-23 The characterization of peptides and proteins is central to understanding their function and expression in biological matrices Moreover these macromolecules are important biomarkers of many human diseases In recent years the performance of separation techniques based on electromigration have significantly increased The development of microdevices has reduced sample consumption and waste production while high sensitivity detectors such as mass spectrometry MS or laser induced fluorescence LIF have significantly improved with regards to separation efficiency and detection limits All of these advancements have led to appreciably enlarged fields of application Nowadays a multitude of studies using separation techniques based on electromigration to study proteins and peptides from numerous real matrices are available in the literature This Special Issue covers the most recent knowledge and advances in the study of peptides and proteins using several electrophoresis techniques as well as the characterization of relevant proteins and peptides in application areas such as clinical studies functional foods and toxicology

The last few years have seen the rapid development of new methodology in the field of molecular biology. New techniques have been regularly introduced and the sensitivity of older techniques greatly improved upon. Developments in the field of genetic engineering in particular have contributed a wide range of new techniques. The purpose of this book therefore is to introduce the reader to a selection of the more advanced analytical and preparative techniques which the editors consider to be frequently used by research workers in the field of molecular biology. In choosing techniques for this book we have obviously had to be selective and for the sake of brevity a knowledge of certain basic biochemical techniques and terminology has been assumed. However, since many areas of molecular biology are developing at a formidable rate and constantly generating new terminology, a glossary of terms has been included. The techniques chosen for this book are essentially based on those used in a series of workshops on techniques in molecular biology that have been held at The Hatfield Polytechnic in recent years. In choosing these chapters we have taken into account many useful suggestions and observations made by participants at these workshops. Each chapter aims to describe both the theory and relevant practical details for a given technique and to identify both the potential and limitations of the technique. Each chapter is written by authors who regularly use the technique in their own laboratories.
