Kaiser,2004-09-29 As the number of electrical devices in use continues to grow so do the challenges of ensuring the electromagnetic compatibility EMC of products and systems Fortunately engineers have at their disposal an array of approximations models and rules of thumb to help them meet those challenges Unfortunately the number of these tools and guidelines is overwhelming and worse still is the thought of investigating their origins and confirming their results The **Electromagnetic Compatibility Handbook** is an unprecedented compilation of the many approximations guidelines models and rules of thumb used in EMC

analyses complete with their sources and their limitations The book presents these in an efficient question and answer format and incorporates an extremely comprehensive set of tables and figures The author has either derived from basic principles or obtained and verified from their original sources all of the expressions in the tables Mathcad was used to generate most of the plots and solve many of the equations and the author includes the Mathcad programs for many of these so users can clearly see the variable assignments assumptions and equations Designed to be of long lasting value to engineers researchers and students the Electromagnetic Compatibility Handbook is ideal both for quick reference and as a textbook for upper level and graduate electrical engineering courses **Electrostatic Hazards** Heinz Haase,1977 **Electrostatic Ignitions of**

Dust Explosions P. Field, 2012-12-02 Handbook of Powder Technology Volume 4 Dust Explosions presents the dust explosion problem in general terms and describes how and why dusts explode This book discusses the various approaches used to deal with the dust explosion hazards Organized into five chapters this volume begins with an overview of the methods used to assess remove or minimize the hazard of dust explosions This text then examines the factors that influence the initiation and severity of an explosion Other chapters consider the explosion prevention and explosion protection techniques This book discusses as well the characteristics of a dust explosion and the historical development of the problem The final chapter deals with the significant concept of explosion protection to reduce the worst effects of an explosion to an acceptable level This book is a valuable resource for managers engineers scientists safety personnel and others involved in the handling and processing of materials in solid particulate form

Investigation of Explosion Characteristics of Multiphase Fuel Mixtures with Air Emmanuel Kwasi Addai, 2016-10-10 Explosion hazards involving mixtures of different states of aggregation continue to occur in facilities where dusts gases or solvents are handled or processed In order to prevent or mitigate the risk associated with these mixtures more knowledge of the explosion behavior of hybrid mixtures is required The aim of this study is to undertake an extensive investigation on the explosion phenomenon of hybrid mixtures to obtain insight into the driving mechanisms and the explosion features affecting the course of hybrid mixture explosions This was accomplished by performing an extensive experimental and theoretical investigation on the various explosion parameters such as minimum ignition temperature minimum ignition energy limiting oxygen concentration lower explosion limits and explosion severity Mixtures of twenty combustible dusts ranging from food substances metals plastics natural products fuels and artificial materials three gases and six solvents were used to carry out this study Three different standard equipments the 20 liter sphere for testing lower explosion limits limiting oxygen concentration and explosion severity the modified Hartmann apparatus for testing minimum ignition energy and the modified Godbert Greenwald GG furnace for testing minimum ignition temperature were used The test protocols were in accordance with the European standard procedures for dust testing for each parameter However modifications were made on each equipment in order to test the explosion properties of gases solvents and hybrid mixtures The experimental results demonstrated a significant decrease of the minimum ignition temperature minimum ignition energy and limiting oxygen concentration of gas or solvent and increase in the likelihood of explosion when a small amount of dust which was either below the minimum explosion concentration or not ignitable by itself was mixed with gas or solvent and vice versa For example methane with minimum ignition temperature of 600 C decreased to 530 C when 30 g m³ of toner dust which is 50 % below its minimum explosible concentration was added A similar explosion behavior was observed for minimum ignition energy and limiting oxygen concentration Furthermore it was generally observed that the addition of a non explosible

concentration of flammable gas or spray to a dust air mixture increases the maximum explosion pressure to some extent and significantly increases the maximum rate of pressure rise of the dust mixture even though the added concentrations of gases or vapor are below its lower explosion limit Finally it could be said that one cannot rely on the explosion properties of a single substance to ensure full protection of an equipment or a process if substances with different states of aggregate are present
