male cones. In fact the wall of the ovule forms the outer coat of the seed, as we will later see.

617. Pollination.—At the time when the pollen is mature the female cones are still erect on the branches, and the scales, which during the earlier stages of growth were closely pressed against one another around the axis, are now spread apart. As the clouds of pollen issue from the clusters of the male cones, some of it is wafted by the wind to the female cones. It is here caught in the open scales, and rolls down to their bases, where some of it falls between those forerops-like processes at the lower end of the ovule. At

to move toward the center of the cell. When the salt solution is removed and the thread of apogynia is again bathed with water, the movement of the water is reversed in the cell. This would suggest that there is some substance dissolved in the cell-sap which does not readily filter out through the membrane, but draws on the water outside. It is this which produces the pressure from within and crowds the membrane out against the cell wall again.
