Mammals and Birds as Bioindicators of Trace Element Contaminations in Terrestrial Environments Elżbieta Kalisińska,2019-03-01 The population explosion that began in the 1960s has been

accompanied by a decrease in the quality of the natural environment e.g. pollution of the air, water and soil with essential and toxic trace elements. Numerous poisonings of people and animals with highly toxic anthropogenic Hg and Cd in the 20th century prompted the creation of the abiotic environment mainly in developed countries. However, the system is insufficient for long-term exposure to low concentrations of various substances that are mainly ingested through food and water. This problem could be addressed by the monitoring of sentinel organisms that accumulate trace elements and as such reflect the rate and degree of environmental pollution. Usually, these are long-lived vertebrates: herbivorous, omnivorous and carnivorous birds and mammals, especially game species. This book describes the responses of the sentinels most commonly used in ecotoxicological studies to 17 trace elements.

Phytoremediation in Food Safety Sesan Abiodun Aransiola, Naga Raju Maddela, 2024-09-13. Phytoremediation is the process that uses plants to remove pollutants from soils. These pollutants are stored in the edible parts of plants and if they are consumed above a certain level, they become a health risk for humans and animals. This book is a critical review of phytoremediation, its direct or indirect effects on food products, and the risks posed by this cost-effective technology in food safety. It shows how different plants are suited for phytoremediation, explains the role of toxicants in the environment, and analyses their effects and risks in the food chain at a global level. It also reviews the extraction methods of toxicants from plants after they are exposed to phytoremediation. Features: Summarizes the phytoremediation technology for effective remediation. Describes different types of pollutants in soils that render food products useless. Identifies the role of phytoremediation in the environment and its advantages and disadvantages. Explains the role of phytoexclusion and phytostabilization in foods and food safety. Includes many case studies to describe the extraction protocols in postharvest for food safety. This book is intended for practitioners in public and private companies involved in soil remediation and food production, as well as graduate students and academics in both developed and developing countries who are involved in soil and environmental sciences, the food industry, agriculture, and biotechnology.
