*Effective Watershed Management for Surface Water Supplies*, 1991-01-01      **Watershed Management for Potable Water Supply** National Research Council, Commission on Geosciences, Environment, and Resources, Water Science and Technology Board, Committee to Review the New York City Watershed Management Strategy, 2000-03-17 In 1997 New York City adopted a mammoth watershed agreement to protect its drinking water and avoid filtration of its large upstate surface water supply Shortly thereafter the NRC began an analysis of the agreement's scientific validity The resulting book finds New York City's watershed agreement to be a good template for proactive watershed management that if properly implemented will maintain high water quality However it cautions that the agreement is not a guarantee of permanent filtration avoidance because of changing regulations uncertainties regarding pollution sources advances in treatment technologies and natural variations in watershed conditions The book recommends that New York City place its highest priority on pathogenic microorganisms in the watershed and direct its resources toward improving methods for detecting pathogens understanding pathogen transport and fate and demonstrating that best management practices will remove pathogens Other recommendations which are broadly applicable to surface water supplies across the country target buffer zones stormwater management water quality monitoring and effluent trading

*Operational Guide to AWWA Standard G300, Source Water Protection*, 2010      [Natural and Engineered Solutions for Drinking Water Supplies](#) Emily Alcott, Mark S Ashton, Bradford S Gentry, 2013-03-26 Illuminating opportunities to develop a more integrated approach to municipal water system design [Natural and Engineered Solutions for Drinking Water Supplies](#) Lessons from the Northeastern United States and [Directions for Global Watershed Management](#) explores critical factors in the decision making

processes for municipal water system delivery The book offers vital insights to help inform management decisions on drinking water supply issues in other global regions in our increasingly energy and carbon constrained world The study evaluates how six cities in the northeastern United States have made environmental economic and social decisions and adopted programs to protect and manage upland forests to produce clean drinking water throughout their long histories New York New York Boston and Worcester Massachusetts New Haven and Bridgeport Connecticut and Portland Maine have each managed city watersheds under different state regulations planning and development incentives biophysical constraints social histories and ownerships Some of the overarching questions the book addresses relate to how managers should optimize the investments in their drinking water systems What is the balance between the use of concrete steel treatment plants gray infrastructure and forested grassland wetland areas green infrastructure to protect surface water quality The case studies compare how engineered and or natural systems are employed to protect water quality The conclusions drawn establish that it makes environmental economic and social sense to protect and manage upland forests to produce water as a downstream service Such stewardship is far more preferable than developing land and using engineering technology and artificial filtration as a solution to maintaining clean drinking water Lessons learned from this insightful study provide effective recommendations for managers and policymakers that reflect the scientific realities of how forests and engineering can be best integrated into effective watershed management programs and under what circumstances
