ETAPS2000 was the third instance of the European Joint Conferences on Theory and Practice of Software ETAPS is an annual federated conference that was established in 1998 by combining a number of existing and new conferences This year it comprised the conferences FOSSACS FASE ESOP CC TACAS and satellite workshops CBS CMCS CoFI GRATRA INT seven invited lectures a panel discussion and ten tutorials The events that comprise ETAPS address various aspects of the system development process including specification design implementation analysis and improvement The languages methodologies and tools which support these activities are all well within its scope The recent blends of theory and practice are represented with an inclination towards theory with a practical motivation on one hand and soundly based practice on the other Many of the issues involved in software design apply to systems in general including hardware systems and the emphasis on software is not intended to be exclusive ETAPS is a loose confederation in which each event retains its own identity with a separate program committee and independent proceedings Its format is open ended allowing it to grow and evolve as time goes by Contributed talks and system demonstrations are in synchronized parallel sessions with invited lectures in plenary sessions Two of the invited lectures are reserved for unifying talks on topics of interest to the whole range of ETAPS attendees

**Database Theory - ICDT 2005** Thomas Eiter, Leonid Libkin, 2005-03-01 This volume collects the papers presented at the 10th International Conference on Database Theory ICDT 2005 held during January 5 7 2005 in Edinburgh UK ICDT <http://alpha.luc.ac.be/lucp1080/icdt> has now a long tradition of international conferences providing a biennial scientific forum for the communication of high quality and innovative research results on theoretical aspects of all forms of database systems and database technology The conference usually takes place in Europe and has been held in Rome 1986 Bruges 1988 Paris 1990 Berlin 1992 Prague 1995 Delphi 1997 Jerusalem 1999 London 2001 and Siena 2003 so far ICDT has merged with the Symposium on Mathematical Fundamentals of Database Systems MFDBS initiated in Dresden in 1987 and continued in Visegrad in 1989 and Rostock in 1991 ICDT had a two stage submission process First 103 abstracts were submitted which were followed a week later by 84 paper submissions From these 84 submissions the ICDT Program Committee selected 24 papers for presentation at the conference Most of these papers were extended abstracts and preliminary reports on work in progress It is anticipated that most of these papers will appear in a more polished form in scientific journals

Freedom and Enforcement in Action Janusz Czelakowski, 2015-06-10 Action theory is the object of growing attention in a variety of scientific disciplines and this is the first volume to offer a synthetic view of the range of approaches possible in the topic The volume focuses on the nexus of formal action theory with a startlingly diverse set of subjects which range from logic linguistics artificial intelligence and automata theory to jurisprudence deontology and economics It covers semantic mathematical and logical aspects of action showing how the problem of action breaks the boundaries of traditional branches of logic located in syntactics and semantics and now lies on the borderline between logical pragmatics and praxeology The chapters here focus on specialized tasks in formal action theory beginning with a thorough description and formalization of the language of action and moving through material on the differing models of action theory to focus on probabilistic models the relations of formal action theory to deontic logic and its key applications in algorithmic and

programming theory The coverage thus fills a notable lacuna in the literary corpus and offers solid formal underpinning in cognitive science by approaching the problem of cognition as a composite action of mind

**Efficient Parallel Algorithms** Alan Gibbons, Wojciech Rytter, 1989-11-24 Mathematics of Computing Parallelism

**Problem-Solving Methods** Dieter Fensel, 2003-05-15 Researchers in Artificial Intelligence have traditionally been classified into two categories the neaties and the scruffies According to the scruffies the neaties concentrate on building elegant formal frameworks whose properties are beautifully expressed by means of definitions lemmas and theorems but which are of little or no use when tackling real world problems The scruffies are described by the neaties as those researchers who build superficially impressive systems that may perform extremely well on one particular case study but whose properties and underlying theories are hidden in their implementation if they exist at all As a life long non card carrying scruffy I was naturally a bit suspicious when I first started collaborating with Dieter Fensel whose work bears all the formal hallmarks of a true neaty Even more alarming his primary research goal was to provide sound formal foundations to the area of knowledge based systems a traditional stronghold of the scruffies one of whom had famously declared it an art thus attempting to place it outside the range of the neaties and to a large extent succeeding in doing so

Programming Languages and Systems Nobuko Yoshida, 2021-03-22 This open access book constitutes the proceedings of the 30th European Symposium on Programming ESOP 2021 which was held during March 27 until April 1 2021 as part of the

**Analysis of Real-World Security Protocols in a Universal Composability Framework** Max Tuengerthal, 2013 Security protocols employed in practice are used in our everyday life and we heavily depend on their security The complexity of these protocols still poses a big challenge on their comprehensive analysis To cope with this complexity a promising approach is modular security analysis based on universal composability frameworks such as Canetti's UC model This appealing approach has however only very rarely been applied to the analysis of existing real world protocols Either the analysis was not fully modular or it could only be applied to idealized variants of the protocols The main goal of this thesis therefore is to push modular protocol analysis as far as possible but without giving up

on accurate modeling Our main contributions in a nutshell An ideal functionality for symmetric key cryptography that provides a solid foundation for faithful composable cryptographic analysis of real world security protocols A computational soundness result of formal analysis for key exchange protocols that use symmetric encryption Novel universal and joint state composition theorems that are applicable to the analysis of real world security protocols Case studies on several security protocols SSL TLS IEEE 802 11i WPA2 SSH IPsec and EAP PSK We showed that our new composition theorems can be used for a faithful modular analysis of these protocols In addition we proved composable security properties for two central protocols of the IEEE standard 802 11i namely the 4 Way Handshake Protocol and the CCM Protocol This constitutes the first rigorous cryptographic analysis of these protocols While our applications focus on real world security protocols our theorems models and techniques should be useful beyond this domain Randomness and Completeness in Computational Complexity

Dieter van Melkebeek,2003-06-29 This book contains a revised version of the dissertation the author wrote at the Department of Computer Science of the University of Chicago The thesis was submitted to the Faculty of Physical Sciences in conformity with the requirements for the PhD degree in June 1999 It was honored with the 1999 ACM Doctoral Dissertation Award in May 2000 Summary Computational complexity is the study of the inherent difficulty of computational problems and the power of the tools we may use to solve them It aims to describe how many resources we need to compute the solution as a function of the problem size Typical resources include time on sequential and parallel architectures and memory space As we want to abstract away from details of input representation and specifics of the computer model we end up with classes of problems that we can solve within certain robust resource bounds such as polynomial time parallel logarithmic time and logarithmic space Research in complexity theory boils down to determining the relationships between these classes inclusions and separations In this dissertation we focus on the role of randomness and look at various properties of hard problems in order to obtain separations We also investigate the power of nondeterminism and alternation as well as space versus time issues Randomness provides a resource that seems to help in various situations *Proceedings of the Sixth ACM SIGPLAN International Conference on Functional Programming (ICFP '01), Florence, Italy, September 3-5, 2001*,2001

**Progress in Cryptology - INDOCRYPT 2005** Subhamoy Maitra,C.E. Veni Madhavan,Ramarathnam Venkatesan,2005-11-15 This book constitutes the refereed proceedings of the 6th International Conference on Cryptology in India INDOCRYPT 2005 held in Bangalore India in December 2005 The 31 revised full papers presented together with 1 invited paper were carefully reviewed and selected from 148 submissions The papers are organized in topical sections on sequences boolean function and S box hash functions design principles cryptanalysis time memory trade off new constructions pairings signatures applications e cash and implementations Free Choice Petri Nets Jorg Desel,Javier Esparza,1995-01-12 Petri nets are a model for the analysis of concurrent systems **Stochastic Multiplayer Games** Michael Ummels,2010 Stochastic games provide a versatile model for reactive systems that are affected by random events

This dissertation advances the algorithmic theory of stochastic games to incorporate multiple players whose objectives are not necessarily conflicting. The basis of this work is a comprehensive complexity theoretic analysis of the standard game theoretic solution concepts in the context of stochastic games over a finite state space. One main result is that the constrained existence of a Nash equilibrium becomes undecidable in this setting. This impossibility result is accompanied by several positive results including efficient algorithms for natural special cases.
