In less common type of Monteggia fracture, ulna angulated posteriorly and radial head dislocated posteriorly.

C. Galeazzi fracture

Dislocation of distal radioulnar joint better demonstrated on lateral view.

Clinical appearance of deformity due to severely displaced fracture of distal radius.

D. Fracture of both forearm bones

Fracture of both radius and ulna with angulation, shortening, and comminution of radius.

Open reduction and fixation with compression plates and screws through both cortices. Good alignment, with restoration of radial bow and interosseous space. Postoperative immobilization in long arm cast for 6 to 8 weeks.

Complications

Malunion. Loss of radial bow and narrowing of interosseous space, which greatly impair pronation and supination of forearm.

Cross union. Total loss of rotation and very difficult to correct. Separate incisions on fixation of each bone and minimal operative trauma help minimize this serious complication.
