Handbook Of Experimental Pharmacology Volume 20 Pharmacology Of Fluorides Part :

Pharmacology of Ganglionic Transmission D.A. Kharkevich, 2012-12-06 D A KHARKEVICH The history of the study of ganglionic substances begins with the paper of LANGLEY and DICKINSON 1889 who established the ability of nicotine to block the neurones in the superior cervical ganglion This was a considerable discovery as the authors ascertained that impulses were transmitted from pre to postganglionic neurones in the autonomic ganglia Simultaneously they indicated the possibility of pharmacological influence upon interneuronal transmission in autonomic ganglia The idea of ganglionic receptors specifically sensitive to nicotine followed logically Later LANGLEY 1905 1906 considered the problem of receptors with respect to neuro effector synapses It is remarkable that he was one of the first to put forward the theory of chemical mediation of excitation the nervous impulse should not pass from nerve to muscle by an electric discharge but by the secretion of a special substance at the end of the nerve LANGLEY 1906 p 183 In addition LANGLEY JOHN N LANGLEY 1852 1926 D A KHARKEVICH 2 and his collaborators managed to define the topography of autonomic ganglia more precisely by means of nicotine It should be mentioned that it was he who introduced the terms autonomic nervous system and parasympathetic nervous system **Patty's Toxicology, 6 Volume Set** Eula Bingham, Barbara Cohrsen, 2012-07-31

Featuring the improved format used in the 5th edition this updated set presents in logical groupings comprehensive toxicological data for industrial compounds including CAS numbers physical and chemical properties exposure limits and biological tolerance values for occupational exposures making it essential for toxicologists and industrial hygienists This edition has about 40% new authors who have brought a new and international perspective to interpreting industrial toxicology and discusses new subjects such as nanotechnology flavorings and the food industry reactive chemical control to comprehensive chemical policy metalworking fluids and pharmaceuticals **Ergot Alkaloids and Related Compounds** B. Berde, H.O. Schild, 2012-12-06 With contribution by numerous experts *Clinical Pharmacology of Anti-Epileptic Drugs* H. Schneider, D. Janz, C. Gardner - Thorpe, H. Meinardi, A. L. Sherwin, 2012-12-06 He who is faithfully analysing epilepsy is doing far more than studying epilepsy Hughlings Jackson Modifying this well known statement by Jackson one could say today He who is faithfully analysing anti epileptic drugs is doing far more than studying anti epileptic drugs For these drugs not only serve to prevent epileptic fits and thus advance the treatment of epilepsy they are also effective in the treatment of cardiac arrhythmias and trigeminal neuralgia Furthermore clinical pharmacologists consider anti epileptic drugs as model drugs in pharmacokinetics and pharmacodynamics since reliable methods are available for their determination and their effects and side effects can be defined The methods of estimating of drugs in body fluids provide a tool that enables us to throw light on many obscure relationships in pharmaceutical treatment Now that we can study the pharmacokinetics and interaction of drugs in man many hypotheses based on clinical experience alone may well be eliminated or corroborated The growing body of knowledge will make us more careful about the administration of drugs in combination Now that we can study how

biological parameters interfere with drug action we may perhaps proceed to the scientific analysis of many clinical observations that suggest the importance of such factors as age sex menstrual cycle pregnancy fever diet stress sport climate and altitude

Cyclic Nucleotides P. D. Kebabian, M. D. Nathanson, 2012-12-06 Cyclic nucleotides are intimately involved in the consequences of either stimulation or blockade of receptors therefore an understanding of the biochemistry of cyclic nucleotides ought to be important for pharmacologists Pharmacology is a science that among other things investigates chemical compounds that affect the physiology of cells tissues and organs Frequently pharmacologists account for the effect of low concentrations of a drug upon a tissue by invoking the presence of a receptor upon the surface of the cell Traditional pharmacologists excelled at identifying and classifying the properties of receptors A J CLARK S monograph in the earlier series of the Handbook of Experimental Pharmacology CLARK 1937 summarized the mathematics underlying the traditional pharmacological approach towards receptors By its nature however classic pharmacology provided little useful information about the intracellular events occurring as a consequence of occupying a receptor for example ALQUIST 1948 identified the beta adrenoceptor but he did not provide any insight into how stimulation of the receptor produces tissue specific physiological responses The discovery of cyclic AMP by RALL and SUTHERLAND see RALL Vol I led to biochemical investigations of many different receptors including ALQUIST S beta adrenoceptor that share a cyclic nucleotide as a common factor in the biochemical mechanisms that translate the occupancy of receptors into physiological effects Ten years ago in the introduction to their monograph on cyclic nucleotides ROBISON et al 1971 commented on the rapid growth of interest in cyclic nucleotides over the preceding years

Heme and Hemoproteins K.W. Bock, G.H. Elder, L.G. Israels, G.S. Marcks, F. De Matteis, J.D. Maxwell, U.A. Meyer, H.L. Rayner, H.L. Remmer, S. Sassa, B.A. Schacter, G.H. Tait, T.R. Tephly, D.P. Tschudy, 2012-12-06 The study of the biological effects of foreign chemicals whether therapeutic drugs or chemicals present at work or in the environment interests the biologist from a number of different and complementary viewpoints Apart from the more obvious pharmacological and toxicological interest the experimentalist often uses foreign chemicals to produce in experimental animals disease states similar to naturally occurring diseases so that their pathogenetic mechanisms and therapy can be studied under controlled conditions In addition as Claude Bernard pointed out over a century ago foreign chemicals can be employed as instruments to analyze the most delicate vital processes much can be learned about the physiological processes themselves by a careful study of the mechanisms by which these are altered by chemicals The field of heme and hemoproteins offers an example of the interplay of these different approaches Their metabolism can be altered by therapeutic drugs and other foreign chemicals and this results in a variety of biological responses that transcend the boundaries of pharmacology into the confines of clinical medicine genetics toxicology biochemistry and physiology In this book a multidisciplinary approach to the study of heme metabolism is presented including the effect of chemicals on heme metabolism in patients the results of experimental work in the whole animal as well as in vitro studies

Mediators and

Drugs in Gastrointestinal Motility II ,2012-12-06 This volume places more emphasis on endogenous mediators of gut motility than on drugs used to treat patients with deranged motility In this respect it resembles most other books on gastroenterology for while only a relatively small number of drugs are really useful for a rational therapy a tremendous amount of data is available on neural and hormonal factors regulating the motility of the alimentary canal Moreover it must be considered that some of the drugs which can routinely be employed to modify deranged motility of the digestive system are represented by pure or slightly modified endogenous compounds e g cholecystokinin its C terminal octapeptide and caerulein and it is easy to foresee that their number is destined to increase in the near future Other drugs are simply antagonists of physiological substances acting on specific receptors e g histamine H blockers 2 and opioid compounds The real explosion of research in this field and the extreme specialization often connected with the use of very sophisticated techniques and methodologies would probably have required a larger number of experts to cover some very specific fields from both an anatomical lower esophageal sphincter stomach pylorus small and large intestine and a biochemical hormones candidate hormones locally active substances neurotransmitters etc point of view *Psychotropic Agents* ,2012-12-06

The volumes on psychotropic substances in the Handbook of Experimental Pharmacology series clearly show that the classical concept of this discipline has become too narrow in recent years For instance what substances are psychotropic is determined not by the criteria of the animal trial i e by experimental pharmacology but by their action on the psyche which in the final analysis is only accessible to us in man Psychotropic substances force experimental pharmacology and thus also this Handbook outside its tradition allimits which have essentially depended on animal studies The antipsychotics and antidepressants were not discovered in animal experiments but by chance or more precisely by clinical empiricism Experienced psychiatrists trained in the observation of patients recognised the efficacy of drugs the beneficial effect of which nobody had dreamed of before DELAY and DENICKER in the case of chlorpromazine KLINE in the case of the monoamine oxidase inhibitors and KUHN in the case of imipramine It was only after these discoveries that the pharmacologists developed experimental models of the psychoses in animal experiments However even today we still do not know with certainty which of the effects shown in animals is relevant for the clinical effect despite the vast abundance of individual investigations For many years this uncertainty led to the testing of antipsychotics e g of the neuroleptic type in models which actually produced the undesired effects

Mediators and Drugs in Gastrointestinal Motility I ,2012-12-06 Since the exhaustive Handbook of Physiology Alimentary Canal Section 6 Motility edited by CHARLES F CODE in 1968 no complete survey of the morphological basis and the physiological control of intestinal motility has been published in spite of the enormous amount of new data in the literature on this topic The new techniques and methodologies the use of electron microscopy radioimmunoassay and binding techniques as well as ever more sophisticated electrophysiological procedures have made possible a real flood of discoveries in this field Moreover the possibility of new studies of the endocrine cells in

biopsies of human intestinal mucosa even during routine endoscopies has opened new horizons for gastroenterologists and generated a number of important contributions to our knowledge of the morphology and physiopathology of the gut. As usual, new discoveries have also revealed both ignorance and many new problems. For this reason, although many of the data reported in this volume can be considered as firmly established, others still require confirmation and the results of new research in this field are awaited with extreme interest. Since advances are occurring so rapidly, even experts in the specific topics need frequent comprehensive reviews. To avoid an excessively large volume, considerations of the pancreas, liver and biliary system were not included in this Handbook, which nevertheless has attempted to offer the reader the essence of more than 1 500 papers.

Teratogenesis and Reproductive Toxicology E.M. Johnson, D.M. Kochhar, 2012-12-06 The resolution of links between exposure to components of our complex environment and causation of reproductive effects in the population constitutes an important problem in the field of toxicology. The focus of this volume is developmental toxicology, which represents one aspect of reproductive toxicology dealing with the study of adverse effects on the developing conceptus. Developmental toxicology, which includes teratogenesis as one of its manifestations, provides a fertile field for research in several basic and clinical disciplines; this field also receives input from several disciplines such as developmental and molecular biology, pathology, pharmacology and toxicology, pediatrics and neonatology and epidemiology. More recently, we have seen an emergence of interest in other fields such as perinatal physiology and postnatal behavior, which have now become incorporated into the mainstream of research in this discipline. The present volume is an effort to provide a sampling of concepts currently under active investigation in several of the above fields. The authors have endeavored to provide up to date information on the following topics: detection and analysis of potential hazards to the conceptus in the workplace; pharmacokinetic aspects of the maternal-placental-fetal complex and its relationship to human birth defects and probable mechanisms of teratogenesis as uncovered in certain well defined situations. Also included are summaries of newer investigations on the emerging field of postnatal functional evaluations, i.e. adverse effects on adult activities resultant from in utero exposure to toxic substances.

Fibrinolytics and Antifibrinolytics Fritz Markwardt, 2012-12-06 Disturbances of haemostasis and thromboembolic disorders still constitute a great problem in clinical practice. Increasing insight into the mechanism of blood coagulation has led to more effective therapy and prophylaxis. Particularly the understanding of the biochemistry of fibrinolysis has provided possibilities for the pharmacological interference of these processes, which has resulted in effective haemostatic agents and useful antithrombotic ones. The development of antifibrinolytics for interfering with pathological fibrinolytic processes is nearly complete and has led to the development of drugs essential to the therapy of hyperfibrinolytic bleeding. The search for fibrinolytics for dissolving intravascular thrombi has led to highly effective compounds. This development is still under way and promising results are hoped. Spontaneous dissolution of blood clots is a phenomenon which was described a century ago. First investigations of this process assured that there is in the organism a

system capable of removing the fibrin which is formed during blood coagulation after it has fulfilled its physiological function This fibrinolytic system is specifically adapted to the degradation of insoluble fibrin into soluble degradation products In the past 30 years thorough investigation of this system has clarified the fibrinolytic process its physiological role and its meaning as a pathogenetic principle A good knowledge of these processes is required for an understanding of the effects and side effects of fibrinolytics and antifibrinolytics which comprise the basis of methods for the detection of fibrinolytic processes in the organism and of the control of therapy with these drugs

Cardiac Glycosides, 2012-12-06 The pharmacokinetics of digitalis glycosides have been the subject of extensive review IISALO 1977 ARONSON 1980 PERRIER et al 1977 Research on glycoside kinetics has progressed at a rapid pace requiring continuing reevaluation of the state of our understanding of this problem The present article focuses on the effect of disease states renal gastrointestinal thyroid and cardiac on the absorption distribution and clearance of a number of digitalis glycosides Evidence is critically reviewed and interpreted with respect to possible clinical implications A Renal Insufficiency I Strophanthin Strophanthin disposition in renal failure has been evaluated in only two studies KRAMER et al 1970 determined an elimination half life of 14 h in normals as compared to 60 h in anuric patients Similar results were reported by BRASS and Pm LIPPS 1970 using tritiated strophanthin They found a half life value of 18 h in healthy individuals as compared to 68 h in anuric patients The findings clearly indicate that the elimination half life of strophanthin is prolonged in renal failure

Pyretics and Antipyretics A. S. Milton, 2012-12-06 Fever has always been recognised as the major sign of infectious disease as well as being associated with other illnesses The suggestion of publishing a volume dedicated exclusively to the subject of fever in the Handbook of Experimental Pharmacology series was one that greatly appealed to me and I felt very honoured when I was invited to edit it The first ideas about this volume were conceived in the latter part of 1977 and by the middle of 1978 the first authors had been approached As is usual with such publications by the time the first manuscripts were beginning to arrive in the late spring of 1979 there were still a few chapters for which authors had not yet been found Finally by the end of 1981 the volume was complete Because of the span of time over which the chapters were written some refer to more recent work than others however I do not feel that this detracts from the overall contribution of all the chapters

Antibiotics, 2012-12-06 **Antibiotics** Arnold L. Demain, Nadine A. Solomon, 2012-12-06

Tissue Growth Factors R. Baserga, 2012-12-06 From a logical point of view cell division is regulated by the environment and by the ability of the cell to respond to the environmental signals The terminology of the cell cycle the elaborate mathematical models and the kinetic analyses are all convenient notations and descriptions of the behavior of populations of cells However they tell us very little about the fundamental molecular mechanisms that control cell proliferation Stated in other terms what controls cell reproduction are growth factors in the environment and genes and gene products inside the cell or at its surface This book examines the aforementioned growth

factors the study of which has made very rapid progress in the past few years The selection of topics has been influenced by logistic considerations but the book as a whole gives a broad survey of the state of the art of this exciting field For this thanks are due to the contributors who have given much time to the preparation of the manuscripts and have met the deadline with a punctuality that is uncommon among biomedical scientists I would also like to thank Ms NORA PERRETT and the staff of Springer Verlag for their help in editing the manuscripts and in preparing the production of the book
