Foundations of Real-Time Computing: Scheduling and Resource Management André M. van Tilborg, Gary M.

Koob, 2012-12-06 This volume contains a selection of papers that focus on the state of the art in real time scheduling and resource management Preliminary versions of these papers were presented at a workshop on the foundations of real time computing sponsored by the Office of Naval Research in October 1990 in Washington D C A companion volume by the title Foundations of Real Time Computing Formal Specifications and Methods complements this book by addressing many of the most advanced approaches currently being investigated in the arena of formal specification and verification of real time systems Together these two texts provide a comprehensive snapshot of current insights into the process of designing and building real time computing systems on a scientific basis Many of the papers in this book take care to define the notion of real time system precisely because it is often easy to misunderstand what is meant by that term Different communities of researchers variously use the term real time to refer to either very fast computing or immediate on line data acquisition or deadline driven computing This text is concerned with the very difficult problems of scheduling tasks and resource management in computer systems whose performance is inextricably fused with the achievement of deadlines Such systems have been enabled for a rapidly increasing set of diverse end uses by the unremitting advances in computing power per constant dollar cost and per constant unit volume of space End use applications of deadline driven real time computers span a spectrum that includes transportation systems robotics and manufacturing aerospace and defense industrial process control and telecommunications

Formal Methods and Hybrid Real-Time Systems Cliff B. Jones, Zhiming Liu, Jim Woodcock, 2007-09-04 This Festschrift volume is published to honour both Dines Bjørner and Zhou Chaochen on the occasion of their 70th birthdays The volume includes 25 refereed papers by leading researchers current and former colleagues who congregated at a celebratory symposium held in Macao China in the course of the International Colloquium on Theoretical Aspects of Computing ICTAC 2007 The papers cover a broad spectrum of subjects

Formal Techniques in Real-Time and Fault-Tolerant Systems Jan Vytöpil, 2012-12-06 Formal Techniques in Real Time and Fault Tolerant Systems focuses on the state of the art in formal specification development and verification of fault tolerant computing systems The term fault tolerance refers to a system having properties which enable it to deliver its specified function despite certain faults of its subsystem Fault tolerance is achieved by adding extra hardware and or software which corrects the effects of faults In this sense a system can be called fault tolerant if it can be proved that the resulting extended system under some model of reliability meets the reliability requirements The main theme of Formal Techniques in Real Time and Fault Tolerant Systems can be formulated as follows how do the specification development and verification of conventional and fault tolerant systems differ How do the notations methodology and tools used in design and development of fault tolerant and conventional systems differ Formal Techniques in Real Time and Fault Tolerant Systems is divided into two parts The chapters in Part One

set the stage for what follows by defining the basic notions and practices of the field of design and specification of fault tolerant systems The chapters in Part Two represent the how to section containing examples of the use of formal methods in specification and development of fault tolerant systems The book serves as an excellent reference for researchers in both academia and industry and may be used as a text for advanced courses on the subject

Hard Real-Time Computing Systems Giorgio C Buttazzo, 2007-08-19 Real time computing plays a crucial role in our society since an increasing number of complex systems rely in part or completely on processor control Examples of applications that require real time computing include nuclear power plants railway switching systems automotive electronics air traffic control telecommunications robotics and military systems In spite of this large application domain most of the current real time systems are still designed and implemented using low level programming and empirical techniques without the support of a scientific methodology This approach results in a lack of reliability which in critical applications may cause serious environmental damage or even loss of life This book is a basic treatise on real time computing with particular emphasis on predictable scheduling algorithms The main objectives of the book are to introduce the basic concepts of real time computing illustrate the most significant results in the field and provide the basic methodologies for designing predictable computing systems useful in supporting critical control applications The book is written for instructional use and is organized to enable readers without a strong knowledge of the subject matter to quickly grasp the material Technical concepts are clearly defined at the beginning of each chapter and algorithm descriptions are reinforced through concrete examples illustrations and tables

Real-Time Database Systems Kam-Yiu Lam, Tei-Wei Kuo, 2006-04-18 In recent years tremendous research has been devoted to the design of database systems for real time applications called real time database systems RTDBS where transactions are associated with deadlines on their completion times and some of the data objects in the database are associated with temporal constraints on their validity Examples of important applications of RTDBS include stock trading systems navigation systems and computer integrated manufacturing Different transaction scheduling algorithms and concurrency control protocols have been proposed to satisfy transaction timing data temporal constraints Other design issues important to the performance of a RTDBS are buffer management index accesses and I/O scheduling Real Time Database Systems Architecture and Techniques summarizes important research results in this area and serves as an excellent reference for practitioners researchers and educators of real time systems and database systems

Deadline Scheduling for Real-Time Systems John A. Stankovic, Marco Spuri, Krithi Ramamritham, Giorgio C Buttazzo, 2012-12-06 Many real time systems rely on static scheduling algorithms This includes cyclic scheduling rate monotonic scheduling and fixed schedules created by off line scheduling techniques such as dynamic programming heuristic search and simulated annealing However for many real time systems static scheduling algorithms are quite restrictive and inflexible For example highly automated agile manufacturing command control and communications and distributed real time multimedia applications all

operate over long lifetimes and in highly non deterministic environments Dynamic real time scheduling algorithms are more appropriate for these systems and are used in such systems Many of these algorithms are based on earliest deadline first EDF policies There exists a wealth of literature on EDF based scheduling with many extensions to deal with sophisticated issues such as precedence constraints resource requirements system overload multi processors and distributed systems Deadline Scheduling for Real Time Systems EDF and Related Algorithms aims at collecting a significant body of knowledge on EDF scheduling for real time systems but it does not try to be all inclusive the literature is too extensive The book primarily presents the algorithms and associated analysis but guidelines rules and implementation considerations are also discussed especially for the more complicated situations where mathematical analysis is difficult In general it is very difficult to codify and taxonomize scheduling knowledge because there are many performance metrics task characteristics and system configurations Also adding to the complexity is the fact that a variety of algorithms have been designed for different combinations of these considerations In spite of the recent advances there are still gaps in the solution space and there is a need to integrate the available solutions For example a list of issues to consider includes preemptive versus non preemptive tasks uni processors versus multi processors using EDF at dispatch time versus EDF based planning precedence constraints among tasks resource constraints periodic versus aperiodic versus sporadic tasks scheduling during overload fault tolerance requirements and providing guarantees and levels of guarantees meeting quality of service requirements Deadline Scheduling for Real Time Systems EDF and Related Algorithms should be of interest to researchers real time system designers and instructors and students either as a focussed course on deadline based scheduling for real time systems or more likely as part of a more general course on real time computing The book serves as an invaluable reference in this fast moving field

Fault-Tolerant Real-Time Systems Stefan Poledna, 2007-11-23 Real time computer systems are very often subject to dependability requirements because of their application areas Fly by wire airplane control systems control of power plants industrial process control systems and others are required to continue their function despite faults Fault tolerance and real time requirements thus constitute a kind of natural combination in process control applications Systematic fault tolerance is based on redundancy which is used to mask failures of individual components The problem of replica determinism is thereby to ensure that replicated components show consistent behavior in the absence of faults It might seem trivial that given an identical sequence of inputs replicated computer systems will produce consistent outputs Unfortunately this is not the case The problem of replica non determinism and the presentation of its possible solutions is the subject of Fault Tolerant Real Time Systems The Problem of Replica Determinism The field of automotive electronics is an important application area of fault tolerant real time systems Systems like anti lock braking engine control active suspension or vehicle dynamics control have demanding real time and fault tolerance requirements These requirements have to be met even in the presence of very limited resources since cost is extremely important Because of its interesting properties Fault Tolerant Real

Time Systems gives an introduction to the application area of automotive electronics The requirements of automotive electronics are a topic of discussion in the remainder of this work and are used as a benchmark to evaluate solutions to the problem of replica determinism

Real-Time Database Systems Azer Bestavros, Kwei-Jay Lin, Sang Hyuk Son, 2012-12-06 Despite the growing interest in Real Time Database Systems there is no single book that acts as a reference to academics professionals and practitioners who wish to understand the issues involved in the design and development of RTDBS Real Time Database Systems Issues and Applications fulfills this need This book presents the spectrum of issues that may arise in various real time database applications the available solutions and technologies that may be used to address these issues and the open problems that need to be tackled in the future With rapid advances in this area several concepts have been proposed without a widely accepted consensus on their definitions and implications To address this need the first chapter is an introduction to the key RTDBS concepts and definitions which is followed by a survey of the state of the art in RTDBS research and practice The remainder of the book consists of four sections models and paradigms applications and benchmarks scheduling and concurrency control and experimental systems The chapters in each section are contributed by experts in the respective areas Real Time Database Systems Issues and Applications is primarily intended for practicing engineers and researchers working in the growing area of real time database systems For practitioners the book will provide a much needed bridge for technology transfer and continued education For researchers this book will provide a comprehensive reference for well established results This book can also be used in a senior or graduate level course on real time systems real time database systems and database systems or closely related courses

Formal Methods: State of the Art and New Directions Paul

Boca,Jonathan P. Bowen,Jawed Siddiqi,2009-12-04 Through fundamental contributions from leading researchers this volume describes the use of formal modeling methods in the areas of requirements design and validation The self contained chapters provide readers with rich background information and a diverse breadth of specialist material *Responsive Computer Systems: Steps Toward Fault-Tolerant Real-Time Systems* Donald Fussell,Miroslaw Malek,2012-12-06 Responsive Computer Systems Steps Towards Fault Tolerant Real Time Systems provides an extensive treatment of the most important issues in the design of modern Responsive Computer Systems It lays the groundwork for a more comprehensive model that allows critical design issues to be treated in ways that more traditional disciplines of computer research have inhibited It breaks important ground in the development of a fruitful modern perspective on computer systems as they are currently developing and as they may be expected to develop over the next decade Audience An interesting and important road map to some of the most important emerging issues in computing suitable as a secondary text for graduate level courses on responsive computer systems and as a reference for industrial practitioners *Real-Time Database and Information Systems: Research Advances* Azer Bestavros,Victor Fay-Wolfe,2012-12-06 Real time systems are defined as those for which correctness depends not only on the logical properties of the produced results but also on the temporal properties of these results In a database real time means that in addition to typical logical consistency constraints such as a constraint on a data item s value there are constraints on when transactions execute and on the freshness of the data transactions access The challenges and tradeoffs faced by the designers of real time database systems are quite different from those faced by the designers of general purpose database systems To achieve the fundamental requirements of timeliness and predictability not only do conventional methods for scheduling and transaction management have to be redesigned but also new concepts that have not been considered in conventional database systems or in real time systems need to be added Real Time Database and Information Systems Research Advances is devoted to new techniques for scheduling of transactions concurrency management transaction logging database languages and new distributed database architectures Real Time Database and Information Systems Research Advances is primarily intended for practicing engineers and researchers working in the growing area of real time database and information retrieval systems For practitioners the book will provide a much needed bridge for technology transfer and continued education For researchers the book will provide a comprehensive reference for well established results The book can also be used in a senior or graduate level course on real time systems real time database systems and database systems or closely related courses **Protocol Specification, Testing and Verification, XII** R.J. Linn,M.Ü. Uyar,2016-09-20 For more than a decade researchers and engineers have been addressing the problem of the application of formal description techniques to protocol specification implementation testing and verification This book identifies the many successes that have been achieved within the industrial framework and the difficulties encountered in applying theoretical methods to practical situations Issues discussed include testing and certification verification validation environments and

automated tools formal specifications protocol conversion implementation specification languages and models Consideration is also given to the concerns surrounding education available to students and the need to upgrade and develop this through sponsorship of a study of an appropriate curriculum at both undergraduate and graduate levels It is hoped this publication will stimulate such support and inspire further research in this important arena *Software Engineering Education*

Rosalind L. Ibrahim,1995-02-17 This volume constitutes the proceedings of the 8th Conference on Software Engineering Education SEI CSEE 1995 held in New Orleans Louisiana USA in March April 1995 The volume presents 25 carefully selected full papers by researchers educators trainers and managers from the relevant academic industrial and governmental communities in addition there are abstracts of keynote speeches panels and tutorials The topics covered include curriculum issues Goals what should we be teaching Process issues Software engineering in special domains Requirements and designs People management and leadership skills Technology issues Education and training needs and trends Design Methods for Reactive Systems

Roel Wieringa,2003 This book provides a framework for software design that shows where the techniques and approaches of design methods for software systems fit in It discusses three methods in detail and demonstrates how to pick techniques from each of them It also shows how to follow problem solving steps that focus on the design problem rather than on the method *Computer Aided Verification*

Kim G. Larsen,1992-04-22 This volume contains the proceedings of the third International Workshop on Computer Aided Verification CAV 91 held in Aalborg Denmark July 1 4 1991 The objective of this series of workshops is to bring together researchers and practitioners interested in the development and use of methods tools and theories for automatic verification of finite state systems The workshop provides a unique opportunity for comparing the numerous verification methods and associated verification tools and the extent to which they may be utilized in application design The emphasis is not only on new research results but also on the application of existing results to real verification problems The papers in the volume are organized into sections on equivalence checking model checking applications tools for process algebras the state explosion problem symbolic model checking verification and transformation techniques higher order logic partial order approaches hardware verification timed specification and verification and automata *The Testability of Distributed Real-Time Systems*

Werner Schütz,2007-07-23 BY H KOPETZ A real time computer system must provide the intended service in two dimensions the functional value dimension and the temporal dimension The verification of a real time system implementation is thus necessarily more complex than the verification of a non real time system which has to be checked in the value dimension only Since the formal verification techniques of temporal properties have not yet matured to the point where these techniques can be used in practical system development systematic design and testing are the only alternatives for the development of dependable real time systems At present up to and more than fifty percent of the development effort of complex real time computer systems is spent on testing The test activities are thus a significant cost element in any real time system project The attack on this cost element has to proceed

from two fronts the design for testability and the development of a systematic test methodology supported by an appropriate tool set This book covers both of these topics **Real-Time Systems Engineering and Applications** Michael Schiebe, Saskia Pferrer, 2007-08-28 Real Time Systems Engineering and Applications is a well structured collection of chapters pertaining to present and future developments in real time systems engineering After an overview of real time processing theoretical foundations are presented The book then introduces useful modeling concepts and tools This is followed by concentration on the more practical aspects of real time engineering with a thorough overview of the present state of the art both in hardware and software including related concepts in robotics Examples are given of novel real time applications which illustrate the present state of the art The book concludes with a focus on future developments giving direction for new research activities and an educational curriculum covering the subject This book can be used as a source for academic and industrial researchers as well as a textbook for computing and engineering courses covering the topic of real time systems engineering
