Wright, J.J. Zwislocki, 2012-12-06 When seen from an outsider's vantage point the development of knowledge in the sensory sciences must appear massive and the result of some carefully followed master plan In reality it is the result of numerous relatively independent human endeavors shaped by application of the scientific method The comprehensive construction of quantitative theories of sense organ function has occurred only recently but at an explosive rate prefaced by centuries of expansion in the physical sciences Predicated on this growth the twentieth century may become known as the age of the biological sciences With the exception of a modest number of intellectual giants there were few contributors to the foundations of the sensory sciences before the dawn of this century At least 90% of existing knowledge has been produced by scientists working in laboratories founded since 1920 If any single scientist and his laboratory may be identified with the growth in the sensory sciences it is EDGAR DOUGLAS ADRIAN First Baron of Cambridge and leader of the Physiological Laboratory at Cambridge University England Lord ADRIAN'S influence upon the sensory sciences was great not only in terms of his contribution to knowledge itself but also through the influence which he exerted upon numerous young scientists who spent weeks or years at the Cambridge laboratory and who later returned to their homelands and colleagues with the seeds of vigorous research and quantitative inquiry firmly implanted

Fuzziness and Foundations of Exact and

Inexact Sciences Kofi Kissi Dompere, 2012-08-23 The monograph is an examination of the fuzzy rational foundations of the structure of exact and inexact sciences over the epistemological space which is distinguished from the ontological space It is thus concerned with the demarcation problem It examines exact science and its critique of inexact science The role of fuzzy rationality in these examinations is presented The driving force of the discussions is the nature of the information that connects the cognitive relational structure of the epistemological space to the ontological space for knowing The knowing action is undertaken by decision choice agents who must process information to derive exact inexact or true false conclusions The information processing is done with a paradigm and laws of thought that constitute the input output machine The nature of the paradigm selected depends on the nature of the information structure that is taken as input of the thought processing Generally the information structure received from the ontological space is defective from the simple principles of acquaintances and the limitations of cognitive agents operating in the epistemological space How then do we arrive and claim exactness in our knowledge production system The general conclusion of this book is that the conditions of the fuzzy paradigm with its laws of thought and mathematics present a methodological unity of exact and inexact sciences where every zone of thought has fuzzy covering

1983 National Science Foundation Authorization United States. Congress. House. Committee on Science and Technology. Subcommittee on Science, Research, and Technology,1982 The Physics of Music and Color Leon Gunther,2019-10-14

This undergraduate textbook aids readers in studying music and color which involve nearly the entire gamut of the fundamental laws of classical as well as atomic physics The objective bases for these two subjects are respectively sound and light Their corresponding underlying physical principles overlap greatly Both music and color are manifestations of wave phenomena As a result commonalities exist as to the production transmission and detection of sound and light Whereas traditional introductory physics textbooks are styled so that the basic principles are introduced first and are then applied this book is based on a motivational approach It introduces a subject with a set of related phenomena challenging readers by calling for a physical basis for what is observed A novel topic in the first edition and this second edition is a non mathematical study of electric and magnetic fields and how they provide the basis for the propagation of electromagnetic waves of light in particular The book provides details for the calculation of color coordinates and luminosity from the spectral intensity of a beam of light as well as the relationship between these coordinates and the color coordinates of a color monitor The second edition contains corrections to the first edition the addition of more than ten new topics new color figures as well as more than forty new sample problems and end of chapter problems The most notable additional topics are the identification of two distinct spectral intensities and how they are related beats in the sound from a Tibetan bell AM and FM radio the spectrogram the short time Fourier transform and its relation to the perception of a changing pitch a detailed analysis of the transmittance of polarized light by a Polaroid sheet brightness and luminosity and the mysterious behavior of the photon The Physics of Music and Color is written at a level suitable for college students without any scientific background requiring only simple algebra and a passing familiarity with trigonometry The numerous problems at the end of each chapter help the reader to fully grasp the subject **1981 National Science Foundation Authorization** United States.
