S. Bazaraa, C. M. Shetty, 2012-12-06 Currently there is a vast amount of literature on nonlinear programming in finite dimensions The publications deal with convex analysis and several aspects of optimization On the conditions of optimality they deal mainly with generalizations of known results to more general problems and also with less restrictive assumptions There are also more general results dealing with duality There are yet other important publications dealing with algorithmic development and their applications This book is intended for researchers in nonlinear programming and deals mainly with convex analysis optimality conditions and duality in nonlinear programming It consolidates the classic results in this area and some of the recent results The book has been divided into two parts The first part gives a very comprehensive background material Assuming a background of matrix algebra and a senior level course in Analysis the first part on convex analysis is self contained and develops some important results needed for subsequent chapters The second part deals with optimality conditions and duality The results are developed using extensively the properties of cones discussed in the first part This has facilitated derivations of optimality conditions for equality and inequality constrained problems Further minimum principle type conditions are derived under less restrictive assumptions We also discuss constraint qualifications and treat some of the more general duality theory in nonlinear programming Foundations of Optimization Douglass J. **The influence of demand-side flexibility and technology availability on the cost-optimal carbon-neutral Swiss energy system** Marvin Volkmer, 2024-11-08. Master's Thesis from the year 2024 in the subject Engineering Power Engineering grade 1.0 RWTH Aachen University, language English, abstract. In order to mitigate climate change, Switzerland has committed to carbon neutrality by year 2050 while phasing out its nuclear power plants. Due to the increasing electrification of the Swiss energy system through heat pumps and battery electric vehicles, more renewables have to be installed and integrated into the heat and mobility sector. Besides the installation of storages, a higher degree of energy market integration and demand side flexibilities seems promising to

counteract the deviations between energy supply and demand. However, some measures of potential technologies demand side flexibilities and market integrations are unpopular among the Swiss population as these measures might intervene people's comfort zones. It would be helpful for policymakers to have only few measures at hand for which acceptance should be sought among the population. However, finding combinations of few measures among many leads to an extensive combinatorial problem that we address: conducting an energy system optimization. Solving this optimization problem with a large spatially resolved energy system model is desired yet computationally challenging. Therefore, in this work, we develop two heuristic algorithms: The Intuitive and The Smart. Using a spatially aggregated energy system model, we show that both heuristics result in similar combinations after a few iterations. Besides the development of the heuristic algorithms, we extend the Swiss energy system model considering biomass to energy processes on site, carbon capture, and flexibility options in the electricity, heat, and mobility sector. The Smart uniquely categorizes measures into the categories: technology availability, demand side flexibility, and market integration, as we assume synergetic effects across categories. The results prove our assumption. Both heuristics terminate with a combination of three measures, with one from each category, and show that having a high potential of carbon capture and storage in combination with allowing for abroad compensation of CO<sub>2</sub> is beneficial. This study presents insights into implications of various measures on the Swiss energy system, as well as potential synergies when measures are combined with each other. Furthermore, both heuristic algorithms find suitable solutions for our problem in only few iterations, which is promising with regard to the aforementioned application in large spatially resolved energy system models.

**Foundations of Deep Learning** Fengxiang He, Dacheng Tao, 2025-02-01. Deep learning has significantly reshaped a variety of technologies such as image processing, natural language processing, and audio processing. The excellent generalizability of deep learning is like a cloud to conventional complexity-based learning theory: the over-parameterization of deep learning makes almost all existing tools vacuous. This irreconciliation considerably undermines the confidence of deploying deep learning to security-critical areas including autonomous vehicles and medical diagnosis, where small algorithmic mistakes can lead to fatal disasters. This book seeks to explain the excellent generalizability including generalization analysis via the size-independent complexity measures, the role of optimization in understanding the generalizability, and the relationship between generalizability and ethical security issues. The efforts to understand the excellent generalizability are following two major paths: 1) developing size-independent complexity measures which can evaluate the effective hypothesis complexity that can be learned instead of the whole hypothesis space, and 2) modelling the learned hypothesis through stochastic gradient methods, the dominant optimizers in deep learning via stochastic differential functions, and the geometry of the associated loss functions. Related works discover that over-parameterization surprisingly brings many good properties to the loss functions. Rising concerns of deep learning are seen on the ethical and security issues including privacy preservation and adversarial robustness. Related works also reveal an interplay between them and

generalizability a good generalizability usually means a good privacy preserving ability and more robust algorithms might have a worse generalizability We expect readers can have a big picture of the current knowledge in deep learning theory understand how the deep learning theory can guide new algorithm designing and identify future research directions Readers need knowledge of calculus linear algebra probability statistics and statistical learning theory *Introduction to Foundation Models* Pin-Yu Chen,Sijia Liu,2025-06-12 This book offers an extensive exploration of foundation models guiding readers through the essential concepts and advanced topics that define this rapidly evolving research area Designed for those seeking to deepen their understanding and contribute to the development of safer and more trustworthy AI technologies the book is divided into three parts providing the fundamentals advanced topics in foundation modes and safety and trust in foundation models Part I introduces the core principles of foundation models and generative AI presents the technical background of neural networks delves into the learning and generalization of transformers and finishes with the intricacies of transformers and in context learning Part II introduces automated visual prompting techniques prompting LLMs with privacy memory efficient fine tuning methods and shows how LLMs can be reprogrammed for time series machine learning tasks It explores how LLMs can be reused for speech tasks how synthetic datasets can be used to benchmark foundation models and elucidates machine unlearning for foundation models Part III provides a comprehensive evaluation of the trustworthiness of LLMs introduces jailbreak attacks and defenses for LLMs presents safety risks when find tuning LLMs introduces watermarking techniques for LLMs presents robust detection of AI generated text elucidates backdoor risks in diffusion models and presents red teaming methods for diffusion models Mathematical notations are clearly defined and explained throughout making this book an invaluable resource for both newcomers and seasoned researchers in the field **Current**
