Science and Technology of Fruit Wine Production Maria R. Kosseva, V.K. Joshi, P.S. Panesar, 2016-11-01. Science and Technology of Fruit Wine Production includes introductory chapters on the production of wine from fruits other than grapes including their composition, chemistry, role, quality of raw material, medicinal values, quality factors, bioreactor technology, production optimization, standardization, preservation, and evaluation of different wines, specialty wines, and brandies. Wine and its related products have been consumed since ancient times not only for stimulatory and healthful properties but also as an important adjunct to the human diet by increasing satisfaction and contributing to the relaxation necessary for proper digestion and absorption of food. Most wines are produced from grapes throughout the world; however, fruits other than grapes including apple, plum, peach, pear, berries, cherries, currants, apricot, and many others can also be profitably utilized in the production of wines. The major problems in wine production, however, arise from the difficulty in extracting the sugar from the pulp of some of the fruits or finding that the juices obtained lack in the requisite sugar contents, have higher acidity, more anthocyanins, or have poor fermentability. The book demonstrates that the application of enzymes in juice extraction, bioreactor technology, and biological deacidification (MLF bacteria or deacidifying yeast like *Schizosaccharomyces pombe* and others) in wine production from non-grape fruits needs serious consideration. Focuses on producing non-grape wines, highlighting their flavor, taste, and other quality attributes including their antioxidant properties. Provides a single volume resource that consolidates the research findings and developed technology employed to make wines from non-grape fruits. Explores options for reducing post-harvest losses which are especially high in developing countries. Stimulates research and development efforts in non-grape wines.

Food Processing Handbook James G. Brennan, Alistair S. Grandison, 2012-05-07. The second edition of the Food Processing Handbook presents a comprehensive review of technologies, procedures, and innovations in food processing, stressing topics vital to the food industry today and pinpointing the trends in future research and development. Focusing on the technology involved, this handbook describes the principles and the equipment used, as well as the changes (physical, chemical, microbiological, and organoleptic) that occur during food preservation. In so doing, the text covers in detail such techniques as post-harvest handling, thermal processing, evaporation, and dehydration, freezing, irradiation, high pressure processing, emerging technologies, and packaging. Separation and conversion operations widely used in the food industry are also covered, as are the processes of baking, extrusion, and frying.

In addition it addresses current concerns about the safety of processed foods including HACCP systems traceability and hygienic design of plant and control of food processes as well as the impact of processing on the environment water and waste treatment lean manufacturing and the roles of nanotechnology and fermentation in food processing This two volume set is a must have for scientists and engineers involved in food manufacture research and development in both industry and academia as well as students of food related topics at undergraduate and postgraduate levels From Reviews on the First Edition This work should become a standard text for students of food technology and is worthy of a place on the bookshelf of anybody involved in the production of foods Journal of Dairy Technology August 2008 This work will serve well as an excellent course resource or reference as it has well written explanations for those new to the field and detailed equations for those needing greater depth CHOICE September 2006 Handbook of Food Preservation M.
