Ravdin, Heather L. Katzen, 2012-09-14 With the aging of the baby boomers and medical advances that promote longevity older adults are rapidly becoming the fastest growing segment of the population As the population ages so does the incidence of age related disorders Many predict that 15% 20% of the baby boomer generation will develop some form of cognitive decline over the course of their lifetime with estimates escalating to up to 50% in those achieving advanced age Although much attention has been directed at Alzheimer s disease the most common form of dementia it is estimated that nearly one third of those cases of cognitive decline result from other neuropathological mechanisms In fact many patients diagnosed with

Alzheimer's disease likely have co-morbid disorders that can also influence cognition i.e. vascular cognitive impairment suggesting mixed dementias are grossly under diagnosed. The Clinical Handbook on the Neuropsychology of Aging and Dementia is a unique work that provides clinicians with expert guidance and a hands-on approach to neuropsychological practice with older adults. The book will be divided into two sections: the first addressing special considerations for the evaluation of older adults and the second half focusing on common referral questions likely to be encountered when working with this age group. The authors of the chapters are experts and are recognized by their peers as opinion leaders in their chosen chapter topics. The field of neuropsychology has played a critical role in developing methods for early identification of late-life cognitive disorders as well as the differential diagnosis of dementia. Neuropsychological assessment provides valuable clinical information regarding the nature and severity of cognitive symptoms associated with dementia. Each chapter will reinforce the notion that neuropsychological measures provide the clinician with sensitive tools to differentiate normal age-related cognitive decline from disease-associated impairment and aid in differential diagnosis of cognitive dysfunction in older adults as well as identify cognitive deficits most likely to translate into functional impairments in everyday life.
