Eng Properties Of Nickel Nickel Alloys:

Engineering Properties of Nickel and Nickel Alloys John Everhart, 2012-12-06 Nickel is probably the most versatile of the metallic elements Among alloys containing nickel are some having high corrosion resistance and others that retain excellent strength and ductility from temperatures approaching absolute zero to those near 2000 F Some nickel alloys are strongly magnetic others are virtually nonmagnetic some have low rates of thermal expansion others have high rates some have high electrical resistivities some have practically constant moduli of elasticity one has an elastic memory In addition nickel is magnetostrictive With this wide range of characteristics it is not surprising that there are several thousand alloys containing nickel It is impossible to consider all of these compositions in this publication and therefore several alloys in each of a number of categories have been selected to indicate the properties to be expected of the group Low alloy and constructional nickel containing steels have been excluded on two grounds To do them justice would require excessive space and in addition their applications differ generally from these of the materials under discussion On the other hand nickel containing stainless steels have been included because many of their applications fall into the same areas as those of a number of the high nickel alloys Many of the compositions discussed are proprietary alloys and they are protected by trademarks A list of the trademarks and their owners is included in the appendix **Nickel and Its Alloys** United States. Bureau of Standards, 1924 Materials and Processes of Electron Devices Max Knoll, 2012-12-06 This book is intended to be of assistance to the physicist or engineer concerned with designing and building electron devices such as high vacuum transmitter or amplifier tubes gas or vapor filled rectifiers thyratrons X ray or luminescent tubes glow or incandescent lamps Geiger or ionization counters vacuum photo cells photoconductive cells selenium germanium or silicon rectifiers or transistors For this purpose extensive information is required concerning the composition behavior and handling of materials as well as a thorough knowledge of high vacuum technique necessary for processing electron devices after their assembly The text covers the preparation and working of materials used in these devices the finishing methods for vacuum tubes especially degassing pumping and getter procedures and different production steps of solid state devices This book contains about 2300 references indicated in the text by the author's name and reference number At the end of each chapter the references themselves are listed alphabetically by the author's name and with the title sometimes abbreviated In accordance with the purpose of the book first publications are quoted only when they contain up to date knowledge of the subject in question Patents are treated as references The quotation of a patent gives only a hint of the technical details described there Mentioning or not mentioning a patent does not imply a statement concerning its importance or validity or warning against imitation Expired patents are named in addition to ones still valid Corrosion Resistance of Nickel and Nickel Alloys Against Acids and Lyes Michael Schütze, Raul B. Creep and High Temperature Deformation of Metals and Alloys Stefano

Spigarelli, Elisabetta Gariboldi, 2019-12-12 By the late 1940s and since then the continuous development of dislocation theories have provided the basis for correlating the macroscopic time dependent deformation of metals and alloys known as creep to the time dependent processes taking place within the metals and alloys High temperature deformation and stress relaxation effects have also been explained and modeled on similar bases The knowledge of high temperature deformation as well as its modeling in conventional or unconventional situations is becoming clearer year by year with new contemporary and better performing high temperature materials being constantly produced and investigated This book includes recent contributions covering relevant topics and materials in the field in an innovative way In the first section contributions are related to the general description of creep deformation damage and ductility while in the second section innovative testing techniques of creep deformation are presented The third section deals with creep in the presence of complex loading temperature changes and environmental effects while the last section focuses on material microstructure creep correlations for specific material classes The quality and potential of specific materials and microstructures testing conditions and modeling as addressed by specific contributions will surely inspire scientists and technicians in their own innovative approaches and studies on creep and high temperature deformation
