Engineering Probabilistic Design And Maintenance For Flood Protection:

Engineering Probabilistic Design and Maintenance for Flood Protection R. Cooke, M. Mendel, J. K.

Vrijling, 2013-12-01 The First Conference on Engineering Probability in Flood Defense was organized by the Department of Mathematics and Informatics of the Delft University of Technology and the Department of Industrial Engineering and Operations Research of the University of California at Berkeley and was held on June 12 1995 in Delft. Groups at Berkeley and Delft were both deeply engaged in modeling deterioration in civil structures particularly flood defense structures. The plans for the conference were well under way when the dramatic floods in The Netherlands and California in the winter of 1994/1995 focused world attention on these problems. The design of civil engineering structures and systems is essentially an example of decision making under uncertainty. Although the decision making part of the process is generally acknowledged, the uncertainty in variables and parameters in the design problem is less frequently recognized. In many practical design procedures, the uncertainty is concealed behind sharp probabilistic design targets like once in a thousand years combined with a standardized use of safety factors. The choice of these probabilistic design targets however is based on an assessment of the uncertainty of the variable under consideration and on its assessed importance. The value of the safety factor is governed by similar considerations. Standard practice is simply accumulated experience and engineering judgment. In light of the great number of civil engineering structures that function successfully, one may say that this standard practice has proven itself broadly satisfactory.

Extreme Hydrological Events: New Concepts for Security O.F. Vasiliev, P.H.A.J.M. van Gelder, E.J. Plate, M.V.

Bolgov, 2007-06-17 This proceedings contains the papers which were presented at the NATO Advanced Research Workshop ARW on Extreme Hydrological Events: New Concepts for Security which was held in Novosibirsk Russia from July 11-15 2005. The workshop fell within the NATO priority research topic on Environmental Security: Disaster Forecast and Prevention. At the present time, the necessity of considerable deepening of our understanding about the nature of extreme and catastrophic natural and man-induced events in particular hydrologic ones becomes very topical as well as the development of advanced methods for their prediction including estimating probability of their occurrence and a risk related to them. Another aspect of this hydrological problem is reducing of vulnerability of social economic and engineering systems to the extreme hydrologic

events EHE and decreasing of a degree of their effect on such systems Dealing with these problems needs further refining existing tools for prediction and forecasting of EHE It can be done essentially through revealing mechanisms of their generation and with use of new approaches and methodologies in related branches of hydrology This ARW is targeted to contribute to the critical analysis and assessment of current knowledge on a number of the key issues of hydrology such as extreme hydrological phenomena problems of floods low flows and droughts In view of significant economic losses and actually wide geographical occurrence investigation of these hydrological phenomena is of great scientific and practical importance
