## **Energy And Structure:**

*Modeling and Valuation of Energy Structures* Daniel Mahoney, 2016-01-26  
Commodity markets present several challenges for quantitative modeling. These include high volatilities, small sample data sets and physical operational complexity. In addition, the set of traded products in commodity markets is more limited than in financial or equity markets, making value extraction through trading more difficult. These facts make it very easy for modeling efforts to run into serious problems as many models are very sensitive to noise and hence can easily fail in practice. *Modeling and Valuation of Energy Structures* is a comprehensive guide to quantitative and statistical approaches that have been successfully employed in support of trading operations, reflecting the author's 17 years of experience as a front office quant. The major theme of the book is that simpler is usually better, a message that is drawn out through the reality of incomplete markets, small samples and informational constraints. The necessary mathematical tools for understanding these issues are thoroughly developed, with many techniques, analytical, econometric and numerical, collected in a single volume for the first time. A particular emphasis is placed on the central role that the underlying market resolution plays in valuation. Examples are provided to illustrate that robust approximate valuations are to be preferred to overly ambitious attempts at detailed qualitative modeling.

**Climate Change and Industry Structure in China** Chu Wei, 2020-02-24  
As carbon dioxide is the most significant source of greenhouse gases today, its emission quantity has become a primary focus of governments, scholars and the general public. The author thoroughly studies related theories and literature about industrial structure and climate change and reviews the different development histories of developed countries and China. Based on historical data, this volume discusses the influence of interprovincial industrial structure and income level on carbon emissions and tries to estimate different industrial sectors' carbon emissions. It especially studies the case of Zhejiang Province and analyses several factors which affect CO<sub>2</sub> emissions. **Energy, Environment and Economic Transformation in China** Shiyi Chen, 2018-10-24  
China has achieved rapid economic growth since the market-oriented reform in 1978 and became the second largest economy in the world in 2010. However, the growth model in China is still extensive in nature and may be characterized with high energy consumption and heavy environmental pollutions, etc. In fact, China has successively become the largest carbon emitter since 2007 and the largest energy consumer since 2009 in the world. This book endeavors to analyze whether such energy-driven and environment-restricted economic growth can be sustainable in China in the long run. The book describes the basic situations of energy consumption and environmental pollution in China from the dimensions of industries, regions and energy types. It also introduces the evolution of energy and environmental policies implemented in China. In particular, this book makes use of

the environmental activity analysis model to assess the sustainable transformation of economic model in Chinese industries and regions This model captures the negative externalities of pollutants and estimates the environmental total factor productivity accurately The possibilities of win win development and double dividend are also forecasted This book proposes new methods to measure the environmental total factor productivity evaluate the process of low carbon transformation quantify the structural bonus estimate the abating cost and forecast the win win development and so on Researchers may find these methodologies useful for measuring other pollutants and for analysis in other countries
