Energy from Biomass in Europe Wolfgang Palz,Philippe Chartier,1980 Bio productivity and climate Geographic synthesis Available bioproduct surpluses Possibilities for energy crops Techniques for biomass utilisation Energy scenarios and policies Review of programmes Alternatives and competitive uses for biomass Energy and economic analysis **Energy's Role in Western Europe's Agriculture** Ruth Elleson,1984 Extract The 1973 80 oil price increases did not significantly alter the structure of Western Europe's agricultural sector or the flow of agricultural exports to the region Energy costs represent a relatively small percentage of total input costs with the greenhouse sector the only exception As long as European Community policy continues to support agricultural prices future energy crises are not likely to significantly affect the structure and performance of the region's agriculture Biomass from farm waste and surplus crops can provide only a small part of agriculture's energy requirements and energy crops may never be economically viable **Renewable Energy in Europe** European Renewable Energy Council,2010-08-12 How can the European Union meet its binding 20% renewable energy target in final energy consumption by the year 2020 Which sources offer the best prospects for realizing this goal These are the questions answered by this key book which analyses the current situation of renewable energy in Europe examines the latest technological financial and economic developments and outlines ways in which the renewable energy market can be developed The book is divided into sections examining the integration of renewable energy electricity heating and cooling as well as biofuels All the main technologies are covered with exploration of benefits and applications costs and prices markets and installed capacity policy instruments key countries and success stories targets and long term potential This will be essential reading for policy decision makers at all levels and to all those involved in the development of the renewable energy industry Electrical Energy Generation in Europe Jorge Morales Pedraza,2015-04-21 The present book maximizes reader insights into the current and future roles to be played by different types of renewable energy sources and nuclear energy for the purpose of electricity generation in the European region as a whole and in a select group of European countries specifically This book includes detailed analysis of the different types of renewable energy sources available in different European countries the pros and cons of the use of the different types of renewables and nuclear energy for electricity generation which energy options are available in the different European countries to expand their energy sector in the coming years the impact on the climate and the environment levels of production and consumption and the level of electricity generated by these energy sources amongst others Designed to inform government officials economists scientists and the private and public power industry of the key issues surrounding the future role of different renewable energy sources and nuclear energy in the production of electricity within the European region this book will also describe in detail the evolution of the electrical energy sector in the chosen European region and the problems that several countries are now experiencing in the face of increasing demand for electricity **The Potential for Energy from Biomass in Europe** B.

Rijkema, D. van den Berg, NOVEM Netherlands Agency for Energy and the Environment, 1997 **Biomass for Energy, Environment, Agriculture and Industry** P. Chartier, A.A.C-M. Beenackers, G. Grassi, 2013-05-30 Interest in the use of biomass for non food applications has grown strongly in recent years mainly as a consequence of its potential as a prime renewable energy resource Renewable energies rank highly among the options that will contribute to the prevention of climate change and to security of energy supply in the future Furthermore exploiting biomass is very attractive as a way of dealing with two sensitive issues facing the majority of western European countries today the extent of unemployment and the setting aside of farm lands to limit excess agricultural production The 8th European Conference for Energy Environment Agriculture and Industry held in Vienna October 1994 was larger than any of its predecessors with over 300 refereed contributions from 20 countries worldwide and over 520 participants It was arguably the most significant event to date in this field providing the opportunity for an international exchange of information on the recent progress in developing and implementing renewable biomass based non food technologies Published in 3 volumes the proceedings of this conference therefore contain the most complete overview of the present state of the art Subjects covered include biomass resource base electricity and heat generation transportation fuels chemicals from biomass products from bio and thermochemical conversion technologies economics environmental aspects and opportunities for implementation worldwide in particular in developing countries Apart from the numerous contributions on the most recent results in research development and implementation the publication also contains authoritative reviews on most of the above mentioned areas from leading experts in each field In addition to this it contains a list of key issues for developing a successful strategy leading to a rapid implementation in Europe and abroad As a result it is indispensable for anyone working in this area whether in research demonstration or in policy development **The Sustainability of Renewable Energy in Europe** Simona Bigerna, Carlo Andrea Bollino, Silvia Micheli, 2015-03-18 This book demonstrates that the much needed global shift in energy production and use must happen at a territorial level in order to be truly successful and sustainable This book enables regional implementation efforts by connecting broad EU environmental policies with plans for action at the territorial level analysing efficient resource allocation and cost effectiveness to achieve national objectives Each EU Member State is considered in depth in order to identify the opportunities and challenges of this regional approach The regional dimension of the authors analysis refers to the territorial level NUTS 1 Nomenclature of Territorial Units for Statistics that starting from the administrative borders of the EU countries divides the territory into 97 regions on the basis of major socio economic characteristics Because the model of the EU green economy is characterized typically by top down interventions that focus exclusively on the resource productivity and investment business its practical implementation can be derailed This book provides the pivotal missing piece the detailed territorial comparative analysis necessary to obtain an optimal energy mix of renewable energy sources RES energy conservation and energy efficiency characteristics of each specific local context

Solar Energy Update ,1984 Energy Transition Holistic Impact Challenge (ETHIC): A New Environmental and Climatic Era George Cristian Lazaroiu, Mariacristina Roscia, Vasile Sebastian Dancu, 2024-11-12 This book states that the new environmental challenge will also have to be faced ethically science can provide the tools but people will have to be sensitized so that they make their own environmental ethics The challenge of the new era is the environment and therefore the climate as it does not start outside of us but as a constituent element of our life and therefore lived ethically The new vision proposed in this book is to push technology together with the human being in assuming environmentally ethical behaviors this is the greatest collective action of humanity Sustainable development has allowed an integrated key to the social economic and environmental dimensions Through ethics sustainability can be combined not only by referring to the problem of pollution and the exploitation of natural resources but it creates a new global era that includes all dimensions of people s lives and of society The shared and structured environmental ethics allow an approach that is no longer short term but provide the collective tools to look far in time With this book we want to lay the instrumental technical social and legislative foundations to provide a new methodology for the care of the environment as up to now there has been much discussion but little achieved in a truly ethical way *Energy Planning in Selected European Regions - Methods for Evaluating the Potential of Renewable Energy Sources* Beata Sliz-Szkliniarz, 2014-07-31 Given their potentially positive impact on climate protection and the preservation of fossil resources alternative energy sources have become increasingly important for the energy supply over the past years However the questions arises what economic and ecological impacts and potential conflicts over land use resources are associated with the promotion of renewable energy production Using the examples of three selected European Regions in Poland France and German the dissertation discusses these questions and examines the potential and consequences of an intensified usage of renewable energy sources **The EU's Target for Renewable Energy** Great Britain. Parliament. House of Lords. European Union Committee, 2008 Presents evidence that is taken before Sub committee B Internal Market *European Energy Futures 2030* Timon Wehnert, Juan Pedro López Araguás, Oliviero Bernardini, Lukasz Jaworski, Birte Holst Jørgensen, Wolfram Jörß, Oliver Nielsen, Augusto Ninni, Anna Oniszk-Poplawska, Daniela Velte, 2007-04-27 Foresight is a vital prerequisite in order to bring our current energy system onto the path of sustainable development Which technologies may be available in 25 years from now Which technologies will be needed in the future The European Energy Delphi project EurEnDel aimed at bri ng orienting knowledge to these two questions Trying to show a glimpse of European Energy Futures in the year 2030 This book contains the main results of the EurEnDel project It includes the findings of the European Energy Delphi survey and the resulting recommendations for R D policy In comparison to other industry sectors energy has two very remarkable features For one transformations are very slow Life times of power plants are 30 years and longer Thus the decisions we take today will still have impacts 30 to 50 years from now which makes sound foresight so important On the other hand the energy system is strongly dependent on

national political decisions Priority setting may change quite drastically with new parties coming to power at least for individual country This is one of the reasons why predictions in the energy field can be extremely difficult Combining these two characteristics it becomes evident why foresight in the energy field must not be restricted to an analysis of what the future could be like but must always assess what the future should be like This book tries to weave together these two traces which were inherent in the EurEnDel project

Long-term Energy Security Risks for Europe Arianna Checchi,Arno Behrens,Christian Egenhofer,2009 The aim of the paper is to identify and evaluate existing and potential EU energy supply risks on the basis of a sector specific approach Moving away from common generalisations on security of energy supply as well as from those studies that focus only on one sector it brings together all types of fuel and analyses the risks related to each of them The result is a comprehensive picture of the energy security challenges faced by the EU in the long term The paper can be seen as a tool to avoid overlapping incoherence and contradictions in the process of assessing security of supply and aims to formulate a consistent and more unified European energy policy
