The transition towards renewable energy sources and green technologies for energy generation and storage is expected to mitigate the climate emergency in the coming years. However, in many cases, this progress has been hampered by our dependency on critical materials or other resources that are often processed at high environmental burdens. Yet many studies have shown that environmental and energy issues are strictly interconnected and require a comprehensive understanding of resource management strategies and their implications. Life cycle assessment (LCA) is among the most inclusive analytical techniques to analyze sustainability benefits and trade-offs within complex systems, and in this Special Issue, it is applied to assess the mutual influences of environmental and energy dimensions. The selection of original articles, reviews, and case studies addressed covers some of the main driving applications for energy requirements and greenhouse gas emissions, including power generation, bioenergy, biorefinery, building, and transportation. An insightful perspective on the current topics and technologies and emerging research needs is provided. Alone or in combination with integrative methodologies, LCA can be of pivotal importance and constitute the scientific foundation on which a full system understanding can be reached. *Visualizing Environmental Science* David M. Hassenzahl, Mary Catherine Hager, Linda R. Berg,2017-11-06 The 5th Edition of *Visualizing Environmental Science* provides students with a valuable opportunity to identify and connect the central issues of environmental science through a visual approach. Beautifully illustrated, this fifth edition shows students what the discipline is all about, its main concepts and applications, while also instilling an appreciation and excitement about the richness of the subject. This edition is thoroughly refined and expanded; the visuals utilize insights from research on student learning and feedback from users. **Impacts of Using Biomass as an Energy Source in Homes**

Allana Katiussya Silva Pereira, Ananias Francisco Dias Júnior,2023-08-17 The book deepens understanding of biomass sources and technologies used for cooking worldwide. It contributes directly to the creation of policies aimed at the mitigation of climate change. Historically, wood is considered humanity's first source of energy. Even after decades of use and industrialization processes, it is still considered the most important single source of renewable energy. About a third of the world's population is energetically dependent on wood for cooking and/or heating. Recently, the COVID-19 pandemic made it impossible to purchase fuels such as liquefied petroleum gas (LPG), forcing families in financial difficulties to opt for cheaper and more accessible sources of energy such as wood and vegetable coal. This has been the picture of many families around the world and negatively impacts the environment and energy security. Considering that there are still many wood residues that are wasted and that tropical forests need to be conserved, knowledge about the energy use of wood residues is also

essential This is even more relevant when considering the significant volume of biomass coming from the sustainable management of the largest tropical forest in the world the Amazon Forest The book considers which wood variables should be taken into account when thinking about energy generation how do food cooking technologies contribute to potentiating pollutants emissions and how can these harmful effects be mitigated It describes the chemical composition of biomass and the chemical compounds released during its burning as well as their impacts on the environment and human health It also presents the influence that technologies used in food cooking have on pollutant emissions and which alternatives can be used such as the use of solar energy *Solar Energy Update* ,1979-10 **Energy Research Abstracts** ,1990 *Water Interactions with Energy, Environment, Food and Agriculture Volume I* Maria Concepcion Donoso,2009-02-25 *Water Interactions with Energy Environment Food and Agriculture* is a component of Encyclopedia of Water Sciences Engineering and Technology Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty one Encyclopedias The theme discusses water s importance to energy generation the environment food and agriculture It begins with an analysis of the interrelations between water and the environment Consideration is given to the relationship between water and human health Water s dynamic role in the food production process Ecosystem Character Water Quality and Environment Climate Change and Water Resources Water Resources For Agricultural and Food Production Water Balance in Agriculture Areas Water Contamination from Rural Production Systems Water Interactions with Human Development Economic Development and Cultural Development are considered These two volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts Managers and Decision makers and NGOs **ECONOMIC AND TECHNICAL VIABILITY OF RENEWABLE ENERGY TECHNOLOGIES: Impact of Renewable Energy Technologies on Environment and Climate change Mitigation and contribution to national GDP** Dr RP Gupta,2025-08-20 The book analyses in detail the economic and technical viability of solar pv solar thermal wind and Biomass devices It also deliberates on contribution in nation GDP due to technological intervention Special emphasis has been given to study the impact on environment and climate change mitigation The book also deals with penetration of the programmes in rural areas and policies of the Government in this regard Emphasis on the study of Socio economic aspect also given Engineering of wind turbine and its components has in particular has also been included
