Control and Nonlinear Dynamics on Energy Conversion Systems Herbert Ho-Ching Iu, Abdelali El Aroudi, 2019-07-01 The ever increasing need for higher efficiency smaller size and lower cost make the analysis understanding and design of energy conversion systems extremely important interesting and even imperative One of the most neglected features in the study of such systems is the effect of the inherent nonlinearities on the stability of the system Due to these nonlinearities these devices may exhibit undesirable and complex dynamics which are the focus of many researchers Even though a lot of research has taken place in this area during the last 20 years it is still an active research topic for mainstream power engineers This research has demonstrated that these systems can become unstable with a direct result in increased losses extra subharmonics and even uncontrollability unobservability The detailed study of these systems can help in the design of smaller lighter and less expensive converters that are particularly important in emerging areas of research like electric vehicles smart grids renewable energy sources and others The aim of this Special Issue is to cover control and nonlinear aspects of instabilities in different energy conversion systems theoretical analysis modelling and practical solutions for such emerging applications In this Special Issue we present novel research works in different areas of the control and nonlinear dynamics of energy conversion systems

Variable Gain Control and Its Applications in Energy Conversion Chenghui Zhang, Le Chang, Cheng Fu, 2023-02-24 The variable gain control method is a new construction technique for the control of nonlinear systems By properly conducting state transformation that depends on the variable gains the control design problem of nonlinear systems can be transformed into a gain construction problem thus effectively avoiding the tedious iterative design procedure Different from the classical backstepping method and forwarding design method the structure of variable gain control is simpler in the sense that fewer design parameters are required facilitating the improvement of system control performance To highlight the learning research and promotion of variable gain control *Variable Gain Control and Its Applications in Energy Conversion* is written based on the research results of peers at home and abroad and combining our latest research This book presents innovative

technologies for designing variable gain controllers for nonlinear systems It systematically describes the origin and principles of variable gain control for nonlinear systems focuses on the controller design and stability analysis and reflects the latest research In addition variable gain control methods applied to energy conversion are also included Discussion remarks are provided in each chapter highlighting new approaches and contributions to emphasize the novelty of the presented design and analysis methods In addition simulation results are given in each chapter to show the effectiveness of these methods It can be used as a reference book or a textbook for students with some background in feedback control systems Researchers graduate students and engineers in the fields of control information renewable energy generation electrical engineering mechanical engineering applied mathematics and others will benefit from this book

Renewable Energy Automation and Energy Forecasting Sarat Kumar Sahoo,Franco Fernando Yanine,Vikram

Kulkarni,Akhtar Kalam,2023-12-08 The advancement of sustainable energy is becoming an important concern for many countries The traditional electrical grid supports only one way interaction of power being delivered to the consumers The emergence of improved sensors actuators and automation technologies has consequently improved the control monitoring

and communication techniques within the energy sector including the Smart Grid system With the support of the aforementioned modern technologies the information flows in two ways between the consumer and supplier This data communication helps the supplier in overcoming challenges like integration of renewable technologies management of energy demand load automation and control Renewable energy RE is intermittent in nature and therefore difficult to predict The accurate RE forecasting is very essential to improve the power system operations The forecasting models are based on complex function combinations that include seasonality fluctuation and dynamic nonlinearity The advanced intelligent computing algorithms for forecasting should consider the proper parameter determinations for achieving optimization For this we need new generation research areas like Machine learning ML and Artificial Intelligence AI to enable the efficient integration of distributed and renewable generation at large scale and at all voltage levels The modern research in the above areas will improve the efficiency reliability and sustainability in the Smart grid
