**Network-Genetic Algorithm Technique for Aircraft Engine Performance Diagnostics** Takahisa Kobayashi, 2001 In this paper a model based diagnostic method which utilizes Neural Networks and Genetic Algorithms is investigated Neural networks are applied to estimate the engine internal health and Genetic Algorithms are applied for sensor bias detection and estimation This hybrid approach takes advantage of the nonlinear estimation capability provided by neural networks while improving the robustness to measurement uncertainty through the application of Genetic Algorithms The hybrid diagnostic technique also has the ability to rank multiple potential solutions for a given set of anomalous sensor measurements in order to reduce false alarms and missed detections The performance of the hybrid diagnostic technique is evaluated through some case studies derived from a turbofan engine simulation The results show this approach is promising for reliable diagnostics of aircraft engines      Engine Performance Diagnosis and Tune-up H.M. Prognostics of Aerospace Engines Ravi Rajamani, 2018-11-28 The propulsion system is arguably the most critical part of the aircraft it certainly is the single most expensive component of the vehicle Ensuring that engines operate reliably without major maintenance issues is an important goal for all operators military or commercial Engine health management EHM is a critical piece of this puzzle and has been a part of the engine maintenance for more than five decades In fact systematic condition monitoring was introduced for engines before it was applied to other systems on the aircraft Diagnostics and Prognostics of Aerospace Engines is a collection of technical papers from the archives of SAE International which introduces the reader to a brief history of EHM presents some examples of EHM functions and outlines important future trends The goal of engine health maintenance is ultimately to reduce the cost of operations by catching problems before they become major issues by helping reduce repair times through diagnostics and by facilitating logistic optimization through prognostic

estimates Diagnostics and Prognostics of Aerospace Engines shows that the essence of these goals has not changed over time

**Automotive Engine Performance** Nicholas Goodnight, Kirk VanGelder, 2019-02-20 Automotive Engine Performance published as part of the CDX Master Automotive Technician Series provides technicians in training with a detailed overview of modern engine technologies and diagnostic strategies Taking a strategy based diagnostic approach it helps students master the skills needed to diagnose and resolve customer concerns correctly on the first attempt Students will gain an understanding of current diagnostic tools and advanced performance systems as they prepare to service the engines of tomorrow

Gas Turbine Diagnostics Ranjan Ganguli, 2012-12-13 Widely used for power generation gas turbine engines are susceptible to faults due to the harsh working environment Most engine problems are preceded by a sharp change in measurement deviations compared to a baseline engine but the trend data of these deviations over time are contaminated with noise and non Gaussian outliers Gas Turbine Diagnostics Signal Processing and Fault Isolation presents signal processing algorithms to improve fault diagnosis in gas turbine engines particularly jet engines The algorithms focus on removing noise and outliers while keeping the key signal features that may indicate a fault The book brings together recent methods in data filtering trend shift detection and fault isolation including several novel approaches proposed by the author Each method is demonstrated through numerical simulations that can be easily performed by the reader Coverage includes Filters for gas turbines with slow data availability Hybrid filters for engines equipped with faster data monitoring systems Nonlinear myriad filters for cases where monitoring of transient data can lead to better fault detection Innovative nonlinear filters for data cleaning developed using optimization methods An edge detector based on gradient and Laplacian calculations A process of automating fault isolation using a bank of Kalman filters fuzzy logic systems neural networks and genetic fuzzy systems when an engine model is available An example of vibration based diagnostics for turbine blades to complement the performance based methods Using simple examples the book describes new research tools to more effectively isolate faults in gas turbine engines These algorithms may also be useful for condition and health monitoring in other systems where sharp changes in measurement data indicate the onset of a fault
