Management ,1992 **Management, a Bibliography for NASA Managers** ,1992 NASA SP-7500 United States. National Aeronautics and Space Administration, International Aerospace Abstracts ,1996 *Seeding the Universe with Life: Securing Our Cosmological Future* Michael Noah Mautner,2000 It is the human purpose to propagate Life In this popular science title a well recognized researcher describes how we can seed new solar systems with microbial representatives of our family of organic life The book also describes a life centered astroethics that will motivate these missions based on the unity of all gene protein life a common ancestry a unique complexity and the coincidence of physical laws that allow biology giving life a special place in Nature a shared drive for survival and procreation and a shared future As part of this family it is our purpose to safeguard and expand life in the universe To advance this purpose Professor Mautner pioneered research on the fertilities of extra terrestrial materials in asteroids meteorites The results show that many microorganisms and even plants can grow on resources found commonly in space which are basically similar to Earth materials The conclusions are significant If life can flourish on Earth life can flourish throughout the universe Based on the results on microbes and meteorites the author estimates the ultimate amounts of life that our missions can induce in the cosmological future A life centered astroethics can assure that our descendants will be there to enjoy this future

Geoengineering of the Climate System R M Harrison,R E Hester,2014-05-08 It is generally accepted within the scientific community that anthropogenic emissions of greenhouse gases are primarily responsible for a recent warming in global climate and that current trajectories of emissions may lead to potentially catastrophic changes in climate While reduction in emissions of greenhouse gases and particularly carbon dioxide could lead to a stabilisation of global temperatures this requires international agreements which have yet to be achieved A possible alternative which has been widely mooted is to use methods known as geoengineering as an alternative way of limiting increases in global temperature Geoengineering techniques fall into two main categories of carbon dioxide removal and solar radiation management within each of these there are a number of options Following on from Carbon Capture volume 29 in this series Geoengineering of the Climate System presents an overview of the technologies currently being considered as large scale solutions to climate change and considers some of the possible benefits and disadvantages of each Invited contributions have been received by many of the leading experts on these technologies and the volume provides a comprehensive overview of both carbon dioxide reduction and solar radiation management methods These give rise to important ethical and governance issues which are also explored Written with active researchers postgraduate students and policy makers in mind the latest addition to the Issues in Environmental Science Technology series presents a balanced and informed view of this important field of research and is an essential addition to any environmental science library **The Moon** David Schrunk,Burton Sharpe,Bonnie L. Cooper,Madhu Thangavelu,2007-11-27 This extraordinary book details how the Moon could be used as a springboard for Solar System exploration It presents a realistic plan for placing and servicing telescopes on the Moon and highlights the use

of the Moon as a base for an early warning system from which to combat threats of near Earth objects A realistic vision of human development and settlement of the Moon over the next one hundred years is presented and the author explains how global living standards for the Earth can be enhanced through the use of lunar based generated solar power From that beginning the people of the Earth would evolve into a spacefaring civilisation

Large Space Structures and Systems in the Space Station Era ,1991 *Environmental Biotechnology* Lawrence K. Wang,Volodymyr Ivanov,Joo-Hwa Tay,Yung-Tse Hung,2010-04-05

The past 30 years have seen the emergence of a growing desire worldwide that positive actions be taken to restore and protect the environment from the degrading effects of all forms of pollution air water soil and noise Since pollution is a direct or indirect consequence of waste production the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste However as long as waste continues to exist we can only attempt to abate the subsequent pollution by converting it to a less noxious form Three major questions usually arise when a particular type of pollution has been identified 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved This book is one of the volumes of the Handbook of Environmental Engineering series The principal intention of this series is to help readers formulate answers to the last two questions above The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control However the realization of the ever increasing complexity and interrelated nature of current environmental problems renders it imperative that intelligent planning of pollution abatement systems be undertaken
