Lie Methods in Deformation Theory Marco Manetti, 2022-08-01 This book furnishes a comprehensive treatment of differential graded Lie algebras L_∞ algebras and their use in deformation theory We believe it is the first textbook devoted to this subject although the first chapters are also covered in other sources with a different perspective Deformation theory is an important subject in algebra and algebraic geometry with an origin that dates back to Kodaira Spencer Kuranishi Gerstenhaber and Grothendieck In the last 30 years a new approach based on ideas from rational homotopy theory has made it possible not only to solve long standing open problems but also to clarify the general theory and to relate apparently different features This approach works over a field of characteristic 0 and the central role is played by the notions of differential graded Lie algebra L_∞ algebra and Maurer Cartan equations The book is written keeping in mind graduate students with a basic knowledge of homological algebra and complex algebraic geometry as utilized for instance in the book by Kodaira *Complex Manifolds and Deformation of Complex Structures* Although the main applications in this book concern deformation theory of complex manifolds vector bundles and holomorphic maps the underlying algebraic theory also applies to a wider class of deformation problems and it is a prerequisite for anyone interested in derived deformation theory Researchers in algebra algebraic geometry algebraic topology deformation theory and noncommutative geometry are the major targets for the book

Characters in Low-Dimensional Topology Olivier Collin, Stefan Friedl, Cameron Gordon, Stephan Tillmann, Liam Watson, 2020-12-14 This volume contains the proceedings of a conference celebrating the work of Steven Boyer held from June 2-6 2018 at Universit du Qu bec Montr al Montr al Qu bec Canada Boyer's contributions to research in low dimensional geometry and topology and to the Canadian mathematical community were recognized during the conference The articles cover a broad range of topics related but not limited to the topology and geometry of 3 manifolds properties of their fundamental groups and associated representation varieties

Deformations of Algebraic Schemes Edoardo Sernesi, 2007-04-20 In one sense deformation theory is as old as algebraic geometry itself this is because all algebro geometric objects can be deformed by suitably varying the coefficients of their defining equations and this has of course always been known by the classical geometers Nevertheless a correct understanding of what deforming means leads into the technically most difficult parts of our discipline It is fair to say that such technical obstacles have had a vast impact on the crisis of the classical language and on the development of the modern one based on the theory of schemes and on cohomological methods The modern point of view originates from the seminal work of Kodaira and Spencer on small deformations of complex analytic manifolds and from its formalization and translation into the language of schemes given by Grothendieck I will not recount the history of the subject here since good surveys already exist e.g. [27, 138, 145, 168] Today while this area is rapidly developing a self contained text covering the basic results of

what we can call classical deformation theory seems to be missing Moreover a number of technicalities and well known facts are scattered in a vast literature as folklore sometimes with proofs available only in the complex analytic category This book is an attempt to fill such a gap at least partially
