Empirical Studies Of Programmers 1987 Humancomputer Interaction Series Vol 2:

Human-Centered Software Engineering Ahmed Seffah, Jean Vanderdonckt, Michel C. Desmarais, 2009-06-19 Activity theory is a way of describing and characterizing the structure of human activity of all kinds First introduced by Russian psychologists Rubinshtein Leontiev and Vigotsky in the early part of the last century activity theory has more recently gained increasing attention among interaction designers and others in the human computer interaction and usability communities see for example Gay and H Brooke 2004 Interest was given a significant boost when Donald Norman suggested activity theory and activity centered design as antidotes to some of the putative ills of human centered design Norman 2005 Norman who has been credited with coining the phrase user centered design suggested that too much attention focused on human users may be harmful that to design better tools designers need to focus not so much on users as on the activities in which users are engaged and the tasks they seek to perform within those activities Although many researchers and practitioners claim to have used or been influenced by activity theory in their work see for example Nardi 1996 it is often difficult to trace precisely where or how the results have actually been shaped by activity theory In many cases even detailed case studies report results that seem only distantly related if at all to the use of activity theory Contributing to the lack of precise and traceable impact is that activity theory spite its name is not truly a formal and proper theory **Guide to Advanced Empirical Software Engineering** Forrest Shull, Janice Singer, Dag I. K. Sjøberg, 2007-11-21 Empirical studies have become an important part of software engineering research and practice Ten years ago it was rare to see a conference or journal article about a software development tool or process that had empirical data to back up the claims Today in contrast it is becoming more and more common that software engineering conferences and journals are not only publishing but eliciting articles that describe a study or evaluation Moreover a very successful conference International Symposium on Empirical Software Engineering and Measurement journal Empirical Software Engineering and organization International Software Engineering Research Network have all evolved in the last 10 years that focus solely on this area As a further illustration of the growth of empirical software engineering a search in the articles of 10 software engineering journals showed that the proportion of articles that used the term empirical software engineering doubled from about 6% in 1997 to about 12% in 2006 While empirical software engineering has seen such substantial growth there is not yet a reference book that describes advanced techniques for running studies and their application This book aims to fill that gap The chapters are written by some of the top international empirical software engineering researchers and focus on the practical knowledge necessary for conducting reporting and using empirical methods in software engineering The book is intended to serve as a standard reference Human-computer Interaction-INTERACT., 1990 **ECOOOP '93 - Object-Oriented Programming** Oscar M. Nierstrasz, 2003-05-16 It is now more than twenty five years since object oriented programming was invented actually more than thirty years since work on Simula started but by all accounts it would appear as if object oriented

technology has only been discovered in the past ten years When the first European Conference on Object Oriented Programming was held in Paris in 1987 I think it was generally assumed that Object Oriented Programming like Structured Programming would quickly enter the vernacular and that a conference on the subject would rapidly become superfluous On the contrary the range and impact of object oriented approaches and methods continues to expand and spite the inevitable oversell and hype object oriented technology has reached a level of scientific maturity that few could have foreseen ten years ago Object oriented technology also cuts across scientific cultural boundaries like perhaps no other field of computer science as object oriented concepts can be applied to virtually all the other areas and affect virtually all aspects of the software life cycle So in retrospect emphasizing just Programming in the name of the conference was perhaps somewhat short sighted but at least the acronym is pronounceable and easy to remember This year's ECOOP attracted 146 submissions from around the world making the selection process even tougher than usual The selected papers range in topic from programming language and database issues to analysis and design and reuse and from experience reports to theoretical contributions

Human-Computer Interaction - INTERACT '87 H.-J. Bullinger,B. Shackel,2014-05-21 Since the first INTERACT

Conference in September 1984 the field of Human Computer Interaction has received increasing attention from researchers and industrial practitioners the importance of the topic now being widely recognized Technological developments have made it possible to seek new solutions to the problem of supporting work processes by information technology and for designing the interface between user and the machine Computers have become an everyday and common tool in the work of many people This has motivated the development of an interdisciplinary field of research which now appears much more established than it was a few years ago The INTERACT forums provide the opportunity for regular presentation and discussion of new results from research and application by bringing together the various disciplines and research approaches on a worldwide basis Human Computer Interaction Handbook Julie A. The Cognitive Artifacts of Designing Willemien Visser,2006-08-08 In this dynamic review and synthesis of empirical research and theoretical discussion of design as cognitive activity Willemien Visser reconciles and integrates the classical view of design as conceptualized by Herbert Simon s symbolic information processing approach with modern views of design such as the situativity approach as formulated by Donald Schon The author goes on to develop her own view on design in which design is most appropriately characterized as a construction of representations She lays the groundwork for the integration of design research and cognitive science This seemingly simple framework has implications that set the stage for this mutually beneficial integration
