Computer Simulation Study of Collective Phenomena in Dense Suspensions of Red Blood Cells under Shear Heinrich Krüger, 2012-07-18 The rheology of dense red blood cell suspensions is investigated via computer simulations based on the lattice Boltzmann the immersed boundary and the finite element methods The red blood cells are treated as extended and deformable particles immersed in the ambient fluid In the first part of the work the

numerical model and strategies for stress evaluation are discussed In the second part the behavior of the suspensions in simple shear flow is studied for different volume fractions particle deformabilities and shear rates Shear thinning behavior is recovered The existence of a shear induced transition from a tumbling to a tank treading motion is demonstrated The transition can be parameterized by a single quantity namely the effective capillary number It is the ratio of the suspension stress and the characteristic particle membrane stress At the transition point a strong increase in the orientational order of the red blood cells and a significant decrease of the particle diffusivity are observed However the average cell deformation shows no signature of the transition
