Free text retrieval systems: A review and evaluation. London: Taylor Graham, 1989. 120 pp. ISBN 0 84738 425. £19.50

Produced by members of the Inter University Network Committee Free Text Retrieval Working Party, this book has a value for anyone involved in systems management. Although directed primarily at the academic environment, Chapter two provides a useful summary of the role of free-text software, the nature of free text and the functions of free-text software, detailing comparisons between this and IR/RS packages (which contain few built-in tools for the analysis of free strings). In this area, too, one of the key values of the book is that it addresses the fundamental differences between the two types of package.

The underlying principle of the book is to evaluate currently available free-text retrieval software packages on their ability to meet various criteria considered essential for effective free-text searching. To achieve this three packages — STATUS, BERSERK SEARCH and HANS — were selected for evaluation. Reasons for selecting these packages, for example, ASSASSIN, are explained in an appendix, and the three major packages are given an extensive treatment in chapter three, outlining the reasons for their choice.

The packages have been tested against a standard set of tasks which were developed to form a 'bench mark'. These tasks were varied, and consisted of a fairly large number of electronic mail messages, a complete Shakespeare play, the six books of Homer's *Iliad* in the original Greek and a MARC record bibliography record.

Chapters five and six move on to the merits and faults of the packages, covering the selected packages' interface capabilities, including such items as command language, customised screens and menus and integration with conventional IR/RS. Chapter six outlines in greater detail the ability of

the software to meet criteria considered essential in a 'good' free-text retrieval package. Described by the authors as a 'functions checklist', this section, and chapter five, offer summaries of the findings of the group for each function considered. Included in the checklist are items associated with text structure, retrieval, output, control of terminology, updating facilities, recovery, privacy and security, administration and system monitoring.

The purpose of the book, to evaluate the capabilities of the software package in an academic environment, is achieved admirably. However, it could be argued that the book is equally valuable for the inclusion of useful tips, it is possible to gain from it, in particular those covered in chapter seven. This section covers aspects such as costs, updates and reader support, all of which, although they should be common sense, are all too often overlooked when considering software for purchase.

In the above context the contents of this book can be applied to any environment, and not simply the academic background in which the research was carried out.

In addition the findings of the working party could provide a springboard for further research and the report is virtually a systems manager's work-book in the area of free-text retrieval — a very useful piece of material to have on one's bookshelf!

Suzanne Gourlatko
*The evolution of information: Evolving
Process*, 1988. 302 pp. ISBN 0 86187 878 7. £35.00.

The Grand Synthesis (GS) approach to scholarship is not fashion-de the days, so that it is refreshing to encounter authors and books which take this path. Suzanne Gourlatko does so with a voraciousness in presenting a concept of information flow as the basis for biological and cultural evolution.

Like all GS, this work contains elements which are challenging and

stimulating, but, like most of its kind, it is somewhat short on solid fact and detail. The writing is very general, consisting in the main of a literature review which can best be described as an overview of overviews. The book ends with recommendations for detailed studies, if a few of these had actually been done and described, it would have given the reader a feeling of firmer ground underfoot. There are many references to the literature, most to the supporting scientific disciplines from which the ideas are drawn. Very few are to authors who have written on the nature and significance of information; there is no mention of Hesse, Bateson, Bohm, MacLure, Stengers, ...

Gourlatko's basic thesis is that evolution can be described, or perhaps even explained, by 'flowlines' of information/energy in three domains: the biological, the cultural, and the 'cosmological' (the domain of extended information systems). It is difficult to avoid the feeling that this is very vague, as well as less authoritative than Hesse's analyses of Popper's World 1, 2 and 3 (which do not appear in the bibliography).

I have to admit a feeling of distrust for any model in which information is regarded as a fluid flowing between compartments, although it should be said that Gourlatko himself notes the conceptual difficulties implicit in this approach. I am also highly dubious about any publication based around a statement beginning 'information ...' — in this case 'an organising mechanism which provides an ability to deal with the environment'. I tend to regard such statements as on a par with 'life ...' or 'truth is ...' and liable to cause more trouble than they're worth. Having said that, this book is no worse than other GS, which rely on such statements, and considerably better than most.

Read this book as an interesting statement of a personal viewpoint, and, as well written (right through the speculative argument). For a thorough review of the literature, or a detailed analysis of any particular concept, look elsewhere.
