## **Using Simulation Methods for Bayesian Econometric Models: Inference, Development, and Communication**

John Geweke\*

and University of Minnesota

### **ABSTRACT**

This paper surveys the fundamental principles of subjective Bayesian inference in econometrics and the implementation of those principles using posterior simulation methods. The emphasis is on the combination of models and the development of predictive distributions. Moving beyond conditioning on a fixed number of completely specified models, the paper introduces subjective Bayesian tools for formal comparison of these models with as yet incompletely specified models. The paper then shows how posterior simulators can facilitate communication between investigators (for example, econometricians) on the one hand and remote clients (for example, decision makers) on the other, enabling clients to vary the prior distributions and functions of interest employed by investigators. A theme of the paper is the practicality of subjective Bayesian methods. To this end, the paper describes publicly available software for Bayesian inference, model development, and communication and provides illustrations using two simple econometric models.

\*This paper was originally prepared for the Australasian meetings of the Econometric Society in Melbourne, Australia, from July 2–4, 1997. Financial support from National Science Foundation grant SBR-9600040 is gratefully acknowledged, as is fine research assistance from Hulya Eraslan and John Landon-Lane. Siddhartha Chib, William Griffiths, Michael Keane, Dale Poirier, and four anonymous referees provided helpful comments on earlier versions. My understanding of the issues in this paper has greatly benefited from discussions over the years with these and many other individuals, but misconceptions conveyed in this work are entirely my own. The views expressed herein are those of the author and not necessarily those of the Federal Reserve Bank of Minneapolis or the Federal Reserve System.

Econometric Inference Using Simulation Techniques Herman K. van Dijk, Alain Monfort, Bryan W. Brown, 1995-07-11 This book provides a comprehensive assessment of the latest simulation techniques and examines the three main areas of econometric inference where the use of simulation methods has been successful Bayesian inference classical inference and the solution and stochastic simulation of dynamic econometric models in particular general equilibrium models

Brown, 1993 *Stochastic Processes: Modeling and Simulation* D N Shanbhag, Calyampudi Radhakrishna Rao, 2003-02-24 This sequel to volume 19 of Handbook on Statistics on Stochastic Processes Modelling and Simulation is concerned mainly with the theme of reviewing and in some cases unifying with new ideas the different lines of research and developments in stochastic processes of applied flavour This volume consists of 23 chapters addressing various topics in stochastic processes These include among others those on manufacturing systems random graphs reliability epidemic modelling self similar processes empirical processes time series models extreme value therapy applications of Markov chains modelling with Monte Carlo techniques and stochastic processes in subjects such as engineering telecommunications biology astronomy and chemistry particular with modelling simulation techniques and numerical methods concerned with stochastic processes The scope of the project involving this volume as well as volume 19 is already clarified in the preface of volume 19 The present volume completes the aim of the project and should serve as an aid to students teachers researchers and practitioners interested in applied stochastic processes **Monte Carlo**

**Simulation for Econometricians** Jan F. Kiviet, 2012 Monte Carlo Simulation for Econometricians presents the fundamentals of Monte Carlo simulation MCS pointing to opportunities not often utilized in current practice especially with regards to designing their general setup controlling their accuracy recognizing their shortcomings and presenting their results in a coherent way The author explores the properties of classic econometric inference techniques by simulation The first three chapters focus on the basic tools of MCS After treating the basic tools of MCS Chapter 4 examines the crucial elements of analyzing the properties of asymptotic test procedures by MCS Chapter 5 examines more general aspects of MCS such as its history possibilities to increase its efficiency and effectiveness and whether synthetic random exogenous variables should be kept fixed over all the experiments or be treated as genuinely random and thus redrawn every replication The simulation techniques that we discuss in the first five chapters are often addressed as naive or classic Monte Carlo methods However simulation can also be used not just for assessing the qualities of inference techniques but also directly for obtaining inference in practice from empirical data Various advanced inference techniques have been developed which incorporate simulation techniques An early example of this is Monte Carlo testing which corresponds to the parametric bootstrap technique Chapter 6 highlights such techniques and presents a few examples of semi parametric bootstrap

techniques This chapter also demonstrates that the bootstrap is not an alternative to MCS but just another practical inference technique which uses simulation to produce econometric inference Each chapter includes exercises allowing the reader to immerse in performing and interpreting MCS studies The material has been used extensively in courses for undergraduate and graduate students The various chapters all contain illustrations which throw light on what uses can be made from MCS to discover the finite sample properties of a broad range of alternative econometric methods with a focus on the rather basic models and techniques

**The Econometrics of Panel Data** László Mátyás, Patrick Sevestre, 2013-12-01 The aim of this volume is to provide a general overview of the econometrics of panel data both from a theoretical and from an applied viewpoint Since the pioneering papers by Edwin Kuh 1959 Yair Mundlak 1961 Irving Hoch 1962 and Pietro Balestra and Marc Nerlove 1966 the pooling of cross sections and time series data has become an increasingly popular way of quantifying economic relationships Each series provides information lacking in the other so a combination of both leads to more accurate and reliable results than would be achievable by one type of series alone Over the last 30 years much work has been done investigation of the properties of the applied estimators and test statistics analysis of dynamic models and the effects of eventual measurement errors etc These are just some of the problems addressed by this work In addition some specific difficulties associated with the use of panel data such as attrition heterogeneity selectivity bias pseudo panels etc have also been explored The first objective of this book which takes up Parts I and II is to give as complete and up to date a presentation of these theoretical developments as possible Part I is concerned with classical linear models and their extensions Part II deals with nonlinear models and related issues logit and probit models latent variable models duration and count data models incomplete panels and selectivity bias point processes and simulation techniques

**The Econometrics of Panel Data** László Mátyás, Patrick Sevestre, 2008-04-06 This restructured updated Third Edition provides a general overview of the econometrics of panel data from both theoretical and applied viewpoints Readers discover how econometric tools are used to study organizational and household behaviors as well as other macroeconomic phenomena such as economic growth The book contains sixteen entirely new chapters all other chapters have been revised to account for recent developments With contributions from well known specialists in the field this handbook is a standard reference for all those involved in the use of panel data in econometrics

**Financial Risk Management with Bayesian Estimation of GARCH Models** David Ardia, 2008-05-08 This book presents in detail methodologies for the Bayesian estimation of single regime and regime switching GARCH models These models are widespread and essential tools in financial econometrics and have until recently mainly been estimated using the classical Maximum Likelihood technique As this study aims to demonstrate the Bayesian approach offers an attractive

alternative which enables small sample results robust estimation model discrimination and probabilistic statements on nonlinear functions of the model parameters The author is indebted to numerous individuals for help in the preparation of this study Primarily I owe a great debt to Prof Dr Philippe J Deschamps who inspired me to study Bayesian econometrics suggested the subject guided me under his supervision and encouraged my research I would also like to thank Prof Dr Martin Wallmeier and my colleagues of the Department of Quantitative Economics in particular Michael Beer Roberto Cerratti and Gilles Kaltenrieder for their useful comments and discussions I am very indebted to my friends Carlos Ord as Criado Julien A Straubhaar Jerome Ph A Taillard and Mathieu Vuilleumier for their support in the elds of economics mathematics and statistics Thanks also to my friend Kevin Barnes who helped with my English in this work Finally I am greatly indebted to my parents and grandparents for their support and encouragement while I was struggling with the writing of this thesis

**Modelling** Gunnar Bårdsen, Øyvind Eitrheim, Eilev Jansen, Ragnar Nymoen, 2005-04-14 Macroeconometric models in many ways the flagships of the economist s profession in the 1960s came under increasing attack from both theoretical economist and practitioners in the late 1970s Critics referred to their lack of microeconomic theoretical foundations ad hoc models of expectations lack of identification neglect of dynamics and non stationarity and poor forecasting properties By the start of the 1990s the status of macroeconometric models had declined markedly and had fallen completely out of and with academic economics Nevertheless unlike the dinosaurs to which they often have been likened macroeconometric models have never completely disappeared from the scene This book describes how and why the discipline of macroeconometric modelling

continues to play a role for economic policymaking by adapting to changing demands in response for instance to new policy regimes like inflation targeting Model builders have adopted new insights from economic theory and taken advantage of the methodological and conceptual advances within time series econometrics over the last twenty years The modelling of wages and prices takes a central part in the book as the authors interpret and evaluate the last forty years of international research experience in the light of the Norwegian main course model of inflation in a small open economy The preferred model is a dynamic model of incomplete competition which is evaluated against alternatives as diverse as the Phillips curve Nickell Layard wage curves the New Keynesian Phillips curve and monetary inflation models on data from the Euro area the UK and Norway The wage price core model is built into a small econometric model for Norway to analyse the transmission mechanism and to evaluate monetary policy rules The final chapter explores the main sources of forecast failure likely to occur in a practical modelling situation using the large scale model RIMINI and the inflation models of earlier chapters as case studies
