Pharmacology of Intestinal Permeation II, 2012-12-06 The intestine particularly the small bowel represents a large surface in the adult 2 human approximately 200 m through which the body is exposed to its environment A vigorous substrate exchange takes place across this large surface nutrients and xenobiotics are absorbed from the lumen into the bloodstream or the lymph and simultaneously the same types of substrate pass back into the lumen The luminal surface of the intestine is lined with a leaky epithelium thus the passage of the substrates in either direction proceeds via both transcellular and intercellular routes Simple and carrier mediated diffusion active transport pinocytosis phagocytosis and persorption are all involved in this passage across the intestinal wall The term intestinal permeation refers to the process of passage of various substances across the gut wall either from the lumen into the blood or lymph or in the opposite direction Permeability is the condition of the gut which governs the rate of this complex two way passage The pharmacologist's interest in the problem of intestinal permeation is twofold on the one hand this process determines the bioavailability of drugs and contributes significantly to the pharmacokinetics and toxicokinetics of xenobiotics on the other hand the pharmacodynamic effects of many drugs are manifested in a significant alteration of the physiological process of intestinal permeation

Physiology of Membrane Disorders Thomas E. Andreoli, Darrell D. Fanestil, Joseph F. Hoffman, Stanley G. Schultz, 2013-11-11 The second edition of *Physiology of Membrane Disorders* represents an extensive revision and a considerable expansion of the first edition Yet the purpose of the second edition is identical to that of its predecessor namely to provide a rational analysis of membrane transport processes in individual membranes cells tissues and organs which in turn serves as a frame of reference for rationalizing disorders in which derangements of membrane transport processes play a cardinal role in the clinical expression of disease As in the first edition this book is divided into a number of individual but closely related sections Part V represents a new section where the problem of transport across epithelia is treated in some detail Finally Part VI which analyzes clinical derangements has been enlarged appreciably

THE EDITORS xi Preface to the First Edition The purpose of this book is to provide the reader with a rational frame of reference for assessing the pathophysiology of those disorders in which derangements of membrane transport processes are a major factor responsible for the clinical manifestations of disease In the present context we use the term membrane transport to refer to those molecular processes whose cardinal function broadly speaking is processes in a catholic sense the vectorial transfer of molecules either individually or as ensembles across biological interfaces the latter including those interfaces which separate different intracellular compartments the cellular and extracellular compartments and secreted fluids such as glomerular filtrate and
