Gas Dynamics Tables for Air Elliott Brothers Howard W. Emmons, 1947 *Applied Gas Dynamics* Ethirajan Rathakrishnan, 2019-02-21 A revised edition to applied gas dynamics with exclusive coverage on jets and additional sets of problems and examples The revised and updated second edition of Applied Gas Dynamics offers an authoritative guide to the science of gas dynamics Written by a noted expert on the topic the text contains a comprehensive review of the topic from a definition of the subject to the three essential processes of this science the isentropic process shock and expansion process and Fanno and Rayleigh flows In this revised edition there are additional worked examples that highlight many concepts including moving shocks and a section on critical Mach number is included that helps to illuminate the concept The second edition also contains new exercise problems with the answers added In addition the information on ram jets is expanded with helpful worked examples It explores the entire spectrum of the ram jet theory and includes a set of exercise problems to aid in the understanding of the theory presented This important text Includes a wealth of new solved examples that describe the features involved in the design of gas dynamic devices Contains a chapter on jets this is the first textbook material available

on high speed jets Offers comprehensive and simultaneous coverage of both the theory and application Includes additional information designed to help with an understanding of the material covered Written for graduate students and advanced undergraduates in aerospace engineering and mechanical engineering Applied Gas Dynamics Second Edition expands on the original edition to include not only the basic information on the science of gas dynamics but also contains information on high speed jets *Calorimetric Determination of Constant-pressure Specific Heats of Carbon Dioxide at Elevated Pressures and Temperatures* Virgil E. Schrock, 1952 The constant pressure specific heat of carbon dioxide has been measured over the range of temperatures and pressures from ambient conditions to 1000 pounds per square inch gage and 1000 degrees F using a steady flow calorimeter operated on an open cycle It appears that the apparatus as used in this determination will yield values with a probable error of 0.5 percent at the highest temperature level considered The results of these tests check the widely accepted spectroscopic data within 1 percent The values at elevated pressure are in reasonable agreement with those derived from the zero pressure spectroscopic values and the application of the Beattie Bridgeman equation of state Only very limited calorimetric data are available in the literature but substantial agreement exists with those considered reliable

Mathematical Theory of Compressible Fluid Flow Richard Von Mises, 2012-12-02 Mathematical Theory of Compressible Fluid Flow covers the conceptual and mathematical aspects of theory of compressible fluid flow This five chapter book specifically tackles the role of thermodynamics in the mechanics of compressible fluids This text begins with a discussion on the general theory of characteristics of compressible fluid with its application This topic is followed by a presentation of equations delineating the role of thermodynamics in compressible fluid mechanics The discussion then shifts to the theory of shocks as asymptotic phenomena which is set within the context of rational mechanics The remaining two chapters is a thorough description of the hodograph method These chapters provide a comparison of the modern integration theories The features characteristics and application of transonic flow are also explored This book is an ideal advanced textbook for both graduate students and research workers *Fundamentals of Gas Dynamics* Howard W.

Gas Tables for Compressible Flow Calculations S. M. Yahya, 2006 The subject of compressible flow or gas dynamics deals with the thermo fluid dynamic problems of gases and vapours It is now an important part of the undergraduate and postgraduate curricula Fundamentals of Compressible Flow covers this subject in fourteen well organised chapters in a lucid style A large mass of theoretical material and equations has been supported by a number of figures and graphical depictions Author's sprawling teaching experience in this subject and allied areas is reflected in the clarity and systematic and logical presentation

Hypersonic and High Temperature Gas Dynamics John David Anderson, 1989 This book is a self contained text for those students and readers interested in learning hypersonic flow and high temperature gas dynamics It assumes no prior familiarity with either subject on the part of the reader If you have never studied hypersonic and or high temperature gas dynamics before and if you have never worked extensively in the area then this book is for you On the other hand if you have worked and or are working in these areas and you want a cohesive presentation of the fundamentals a development of important theory and techniques a discussion of the salient results with emphasis on the physical aspects and a presentation of modern thinking in these areas then this book is also for you In other words this book is designed for two roles 1 as an effective classroom text that can be used with ease by the instructor and understood with ease by the student and 2 as a viable professional working tool for engineers scientists and managers who have any contact in their jobs with hypersonic and or high temperature flow

documents the proceedings of the 6th Colloquium held at the Royal Institute of Technology in Stockholm Sweden 22-26 August 1977. The meeting was held under the auspices of the Royal Swedish Academy of Sciences and the International Academy of Astronautics. The scientific program included over one hundred papers. The contributions in this volume are organized into four parts. Part I contains papers on gaseous detonations. It covers topics such as theoretical model of a detonation cell, spherical detonations in hydrocarbon-air mixtures and shock wave propagation in tubes filled with water foams. Part II presents studies on explosions such as the detonation of hydrogen azide and propagation of a laser-supported detonation wave. Part III examines condensed phase detonations. It includes papers on the mechanism of the divergent and convergent shock waves originating at the charge boundary in detonating liquid homogeneous explosives with unstable detonation front and initiation studies in sensitized nitromethane. Part IV presents discussions on turbulent detonations covering topics such as the computational aspects of turbulent combustion and problems and techniques in turbulent reactive systems.
