Fundamental Electron Interactions with Plasma Processing Gases Loucas G. Christophorou, James K. Olthoff, 2012-12-06 This volume deals with the basic knowledge and understanding of fundamental interactions of low

energy electrons with molecules. It provides an up to date and comprehensive account of the fundamental interactions of low energy electrons with molecules of current interest in modern technology especially the semiconductor industry. The primary electron molecule interaction processes of elastic and inelastic electron scattering, electron impact ionization, electron impact dissociation and electron attachment are discussed and state of the art authoritative data on the cross sections of these processes as well as on rate and transport coefficients are provided. This fundamental knowledge has been obtained by us over the last eight years through a critical review and comprehensive assessment of all available data on low energy electron collisions with plasma processing gases which we conducted at the National Institute of Standards and Technology. NIST Data from this work were originally published in the Journal of Physical and Chemical Reference Data and have been updated and expanded here. The fundamental electron molecule interaction processes are discussed in Chapter 1. The cross sections and rate coefficients most often used to describe these interactions are defined in Chapter 2 where some recent advances in the methods employed for their measurement or calculation are outlined. The methodology we adopted for the critical evaluation, synthesis and assessment of the existing data is described in Chapter 3. The critically assessed data and recommended or suggested cross sections and rate and transport coefficients for ten plasma etching gases are presented and discussed in Chapters 4, 5 and 6.
