Handbook of Naturally Occurring Food Toxicants Miloslav Rechcigl, 2018-02-01 In the last decade an increased concern has been voiced against various environmental hazards particularly chemicals that may cause harm to humans or animals Numerous studies which have dealt with this subject invariably have focused on chemical contaminants of some component of a food chain In contrast much less attention has been paid to the potentially harmful substances that may occur in foodstuffs naturally The purpose of this Handbook is to sensitize the reader to this problem and to provide a systematic overview of the most important naturally occurring food toxicants The Handbook should be of interest to anybody who is concerned with nutritive and health aspects of food Inasmuch as many of the discussed toxicants can be removed or destroyed by a suitable method of food processing it should be of special value to food technologists

The book is split into four main categories: mushrooms, wild plants, ornamental and crop plants and houseplants. Plants are listed by common name to assist the non specialist.

The Cyclic Peptide Toxins of Amanita and Other Poisonous Mushrooms Jonathan Walton, 2018-05-09 Poisonous mushrooms have fascinated scientists and laypersons alike for thousands of years. Almost all mushroom fatalities are due to the genus *Amanita* whose poetic common names death cap, destroying angel attest to their lethality. In his classic 1986 book Theodor Wieland covered the state of our knowledge about the chemistry and biochemistry of the toxins of *Amanita* mushrooms up until that time with a particular focus on the decades of chemical research by him and the Wieland dynasty including his father, brother, brother in law and cousin. Wieland's book is now mainly of historical interest with its exhaustive overview of the early chemical studies done without benefit of methods taken for granted by modern chemists. This book is a complete top to bottom revision of Wieland's 1986 book. The material covers history, chemistry and biology with equal thoroughness. It should be of interest to natural products chemists and biologists, professional and amateur mycologists and toxicologists. The three scientific fields that are most relevant to the book are natural products chemistry, mycology and fungal molecular genetics. Dr Walton is an expert in all three. To maximize the broad utility and appeal of the book care has been taken to define all technical terms specific to a particular discipline so that for example mycologists will be able to understand the relevant chemistry and chemists will be able to understand the relevant fungal biology.
