**Preparative Organic Photochemistry** Alexander Schönberg, 2012-12-06 Abridged and translated Organic photochemistry may be divided into three parts theory which is the province of the physical chemist instrumentation which requires the skill of both physicist and engineer and preparation which falls within the sphere of the organic chemist At one time the same person could cover all three fields without too much difficulty but this has now become virtually impossible because the disciplines involved have expanded in both breadth and depth it is therefore timely to have a separate treatment of preparative organic photochemistry There appears to be no review of the main photochemical reactions which includes the advances made in recent years available to the organic chemist working in the preparative field An exception is the excellent Photochemical Reactions by C R MASSON V BOEKELHEIDE and W A NoYES JR published in 1956 which gives a brief review of the reactions which are important in preparative organic photochemistry The present monograph on the other hand seeks to provide a detailed survey for the chemist the author does not set out to discuss every photochemical reaction in the field of organic chemistry but he does include in addition to those of current interest in the preparative field some

which are likely to be of interest in the future and which result in single end products of known composition The  
photochemical synthesis of highly polymerized products falls outside the scope of the work **Elementary Seismology**
